

Appl. No. : 10/553,078  
Filed : June 23, 2006

### REMARKS

Claims 45 and 54-59 are pending in the instant application. Claims 1, 2, 4, 7, 12, 14, 15, 16, 18-21, 24, 27, 30, 32, 33, 35, 37, 39, 41, 47, 48, 49, 51, and 53 were previously withdrawn from consideration as drawn to non-elected species. Claims 3, 5, 6, 8-11, 13, 17, 22, 23, 25, 26, 28, 29, 31, 34, 36, 38, 40, 42-44, 46, 50, and 52 were previously cancelled. The previous withdrawal and cancellation of claims is not a surrender of subject matter and Applicants reserve the right to pursue this subject matter at a later point in time. Claim 45 has been amended in the current response. Previously presented Claims 60-65 have been added. Support for the amended and Previously presented claims is found throughout the specification as originally filed, for example on page 59 beginning on line 18, page 60 beginning on line 17, page 56 beginning on line 10, and page 54 beginning on lines 12. No Previously presented matter has been added by way of these amendments and additions. Claims 45 and 54-65 are presented for further examination. Reconsideration of the pending claims is respectfully requested.

#### **Objection to the Declaration**

The declaration was objected to by the Examiner for listing the citizenship of the inventors as a nationality (Danish) rather than a country (Denmark).

Applicants note that there is no actual defect or lack of clarity in the declaration; in common usage nationality and country designation are used interchangeably in many legal documents with no detrimental effect. It is regrettable that Applicants should be required to expend resources preparing new documents and obtaining new signatures in order to address this objection, and Applicants respectfully submit that its own resources and those of the PTO could be better spent addressing genuine substantive issues. Accordingly, Applicants request that this objection be withdrawn.

However, in the interest of being fully responsive, should the Examiner maintain the objection, a new declaration will be prepared to state inventor citizenship as "Denmark" rather than "Danish." Upon execution by the inventors, this amended declaration will be duly filed with the Patent and Trademark Office, if the objection is maintained.

**Appl. No.** : **10/553,078**  
**Filed** : **June 23, 2006**

### **Objection to the Abstract**

The abstract of the specification was objected to because it allegedly contains legal phraseology. Applicants submit an amended Abstract herewith.

### **Objections to the Specification**

The specification was further objected to because of typographical errors, including the appearance of Greek symbols as boxes. Finally, the specification was objected to because of the lack of trademark symbols and generic names accompanying the trademarks Herceptin<sup>TM</sup>, Quadramet<sup>TM</sup>, and LymphoCide<sup>TM</sup> where they appear in the text.

Applicants submit herewith a substitute specification which addresses each of the concerns identified above. Specifically, the paragraph beginning on line 8, page 26, has been amended to change the misspelled word “adoptes” to “adopted,” and the paragraph beginning on line 31, page 29 has been amended to replace the word “emergency” with “emergence.” The appearance of Greek symbols as boxes has been corrected, and trademark symbols and generic names have been placed with Herceptin<sup>TM</sup>, Quadramet<sup>TM</sup>, and LymphoCide<sup>TM</sup> where they appear in the text. Accordingly, Applicants respectfully submit that objections to the specification have been overcome.

### **Rejection under 35 U.S.C. § 112, second paragraph**

Claims 45 and 54-59 were rejected as allegedly being indefinite for failing to particularly point out and distinctly claim the subject matter which Applicants regard as the invention. According to the Office Action, these claims are indefinite for reciting the phrases “a polypeptide fragment,” “said fragment comprising a peptide,” and “said polypeptide fragment comprises at the most 15 amino acids” in claim 45. Thus, it is not clear to the Examiner if the peptide and the polypeptide are the same length fragments, and accordingly, the Examiner has interpreted that the polypeptide fragment and the peptide fragment are two different fragments.

**Appl. No.** : **10/553,078**  
**Filed** : **June 23, 2006**

A peptide, as the Examiner correctly states, is minimally an amide combining the amino group of one amino acid with the carboxyl group of another, but a peptide can also be a longer segment, such as a tripeptide, a hexapeptide, a nonapeptide, a decapeptide, and the like. A polypeptide, as indicated by the prefix “poly-,” is a linear combination of two or more amino acids. Therefore, the term “polypeptide” can encompass both proteins and “peptides,” which to those of ordinary skill in the art, are often distinguished by their ability to fold into 3-dimensional structures. Proteins generally have sufficient length to allow folding, whereas peptides generally do not. A polypeptide fragment can thus typically be interpreted to be synonymous with a peptide, unless context indicates otherwise.

Claim 45 has been amended to clarify the subject matter covered by the claim by deleting the word “fragment.” The amended claim defines a polypeptide comprising a peptide consisting of SEQ ID NO 245, 297, 298, 301 and functional equivalents having at least 75% sequence identity thereto, wherein said polypeptide comprises at most 15 amino acids. Because a peptide is a type of polypeptide, as explained above, Applicants believe removal of the word “fragment” will indicate clearly that the peptide of one of the listed SEQ ID NOs, or a functional variant thereof, is all or part of the polypeptide claimed. Each mentioned SEQ ID consists of 9 or 10 amino acids, and the polypeptides as claimed on the whole have at most 15 amino acids. Thus the claimed polypeptide can vary in length.

Applicants submit that this amendment of claim 45 clarifies that the polypeptide comprises or consists of any one of the stated peptides or functional equivalents thereof. Accordingly, Applicants respectfully submit that this objection to the specification has been overcome.

Claims 45 and 54-59 were also rejected as allegedly being indefinite for reciting the phrase “functional equivalents” in claim 45, wherein the function of the peptide is not clear.

The Applicants respectfully submit that the specification states clearly that the term “functional equivalency” relates to equivalent antigenic properties of peptides and variants thereof. Functional equivalents are described on page 54-57 of the application. On page 56 it is stated that the terms “functional equivalents” and “variants” are used interchangeably in the application. As stated, the functional equivalents are variants having at least 75 % sequence

**Appl. No.** : **10/553,078**  
**Filed** : **June 23, 2006**

identity to the peptides identified by the SEQ ID NOs listed. This level of sequence identity to the peptides identified by SEQ ID NOs is maintained to help ensure that the antigenic properties of the peptides are conserved. Therefore, in view of the description, Applicants submit that claim 45 is clear.

**Rejection under 35 U.S.C. § 112, first paragraph**

**Enablement**

Claims 45 and 54-59 were rejected under 35 U.S.C. § 112, first paragraph, as allegedly failing to comply with the enablement requirement. The Examiner asserts that a method for raising a specific T-cell response against an epitope of ML-IAP in an individual as claimed is not described in the specification in such a way as to enable one skilled in the art to which it pertains to make and/or use the invention. The Examiner cites a list of prior art references that allegedly teach that the method as claimed cannot be guaranteed to eliminate tumor cells and cannot be predicted to induce an anti-tumor CTL response.

Applicants respectfully submit that the Examiner has applied a standard of proof to which the claims do not relate. In several situations the Examiner seems to interpret “a specific T-cell response” as stated in Claim 45 as “a response of tumor cell lysis *in vivo*” or even as “a response capable of eliminating tumors completely.” Although desirable, these results are not elements of the pending claims. An anti-tumor CTL response is indeed the ultimate goal of the technology, but Applicants do not claim a measurable anti-tumor response in every instance of administration of one of a claimed polypeptide to a patient. The claims specify polypeptides that are capable of raising a specific T-cell response against that epitope. The claims do not require that the all specific T-cell responses will result in tumor cell destruction by CTL’s in all cases. Tumor cell lysis by T lymphocytes (page 9 of Office Action, end of paragraph 2), for example, is not required by the invention. Moreover, the administration to a patient of a polypeptide epitope capable of raising a specific T-cell response (claim 45) is not incompatible with tumor cell evasion of the immune response in some or all patients. Nor is the lack of a T-cell response in patients that are serum-positive for specific antigens prior to immunization with these antigens (Page 8, of Office Action) incompatible with the claims. In short, the invention as claimed does

not require a predictable, curative T-cell response in all cases. Because a specific T-cell response as claimed is distinct from tumor cell destruction or tumor cell evasion of immune detection, the standard of proof applied by the examiner is not relevant to what is actually claimed. Applicants also note that much of the Examiner's justification for the position that T-cell responses are unpredictable is based upon references that are up to 14 years old. While such references are indeed part of the prior art, they are not particularly illuminating as to the state of the art, in terms of predictability, as of the filing date.

The first series of references cited by the Examiner allegedly "serve to demonstrate that the induction of an anti tumor CTL response after the administration of a tumor peptide is unpredictable." In Apostolopoulos et al and Jager et al, cited by the Examiner, a clear correlation between the presence or absence of antibodies towards the target peptide and the induction of a specific T-cell response is demonstrated. The outcome of administration of a tumor peptide antigen is thus not unpredictable as the Examiner concludes. Bodey et al, also cited by the Examiner on Page 9, first paragraph of the Office Action, actually states that general immune activation directed against the target antigen has been demonstrated in most cases. It is further noted that such vaccines may be used in combination with other therapies. Claim 45 is directed towards a specific T-cell response against an epitope of ML-IAP in an individual, not towards complete regression of tumors by cell lysis of all tumor cells. Semino et al, a study from 1993 also cited by the Examiner, relates to treatment of patients with interferons, and thus does not relate to the induction of a specific T-cell response. Both Ohlen et al and Antonia et al, cited by the Examiner as demonstrating the ineffectiveness of CTLs in lysing tumor cells, discuss mechanisms involved in the development of tolerance to self proteins, not to cancer specific antigens such as ML-IAP. The expression of ML-IAP is cancer-specific, avoiding the problem of induction of tolerance to self proteins that is described in these references. This is the reason ML-IAP is a particularly good target. The outcome of administration of a tumor antigen peptide as ML-IAP is thus not unpredictable as the Examiner alleges. Moreover, tumor cell lysis *in vivo*, which was not observed in the references cited by the Examiner, is not claimed in the present application, as stated above. Applicants submit an IDS herewith containing three references that demonstrate the ability of HLA-restricted peptides to induce a T-cell response in patients.

Andersen et al (Cancer Research, 2000, Vol. 6, pages 869-872), Wobser et al (Cancer Immunology Immunotherapy, 2006, Vol 55, pages 1294-1298), and Otto et al (Vaccine, 2005,

**Appl. No.** : **10/553,078**  
**Filed** : **June 23, 2006**

Vol. 23, pages 884-9) each describe detection of specific T-cell reactivity in patients suffering from leukemia, pancreatic cancer, and melanoma, respectively, against antigens derived from survivin, an apoptosis inhibitor overexpressed in most human cancers. These references indicate that specific T-cell responses can in fact be generated against peptide antigens. Accordingly, Applicants respectfully submit that the specific antigens can be predicted to be capable of inducing specific T-cell responses, and thus, Applicants submit that this objection has been overcome.

The Examiner concludes this portion of the rejection by stating that the specification “does not teach how inoculating an individual with compositions comprising the peptides of SEQ ID NOs 245, 297, 298 or 301 overcomes the back-and-forth struggle between host and tumor”. The claims of the present application make no statement requiring that peptide vaccines overcome tumor cell growth on their own, as the vaccines may be used in combination with other therapies. Applicants submit that the fact that there is a back-and-forth struggle implies the presence of specific T-cell activity, which is the extent of what is claimed in the present application. Applicants further note that the specific peptides as claimed are not expected to induce a T-cell response in all patients, but instead are expected to have a high probability of doing so in a subset of cancer patients, depending on the expressed HLA alleles.

Regarding the use of “functional equivalents” to antigenic peptides, the Examiner also cites two references demonstrating that predicted epitopes often fail to elicit a CTL immune response. Thus, the Examiner asserts that there is no reliable nexus between a theoretical peptide immunogen designed to fit into a particular HLA molecule and the eliciting of an immune response thereby. Applicants themselves state on Page 7 of the specification, in the paragraph beginning on line 5, that it is not possible to readily predict which fragments of a given polypeptide will constitute good antigens. However, an integral aspect of the present invention is the identification of antigenic peptides by screening for T-cell responses using the described ELISPOT assay, which detects release of interferon- $\gamma$  from peripheral blood lymphocytes after the introduction of antigenic peptide candidates. Thus, the peptides described in the current invention are not theoretical peptides designed to fit into a particular HLA molecules, as the Examiner assumes. The peptides of the present invention are clearly distinguished from theoretical peptides as having the ability to induce T-cell responses using live cells *in vitro*. This

**Appl. No.** : **10/553,078**  
**Filed** : **June 23, 2006**

activity provides ample nexus between a candidate peptide vaccine and the elicitation of an immune response thereby.

The examiner alleges in further objections that the specification does not disclose the specific T-cell response to include T cell anergy. However, the induction of T cell anergy would still be compatible with the claims, given the presence of active T-cell induction by the peptides at some measurable level in the exemplary ELISPOT assays in at least some patients' serum.

**Rejection under 35 U.S.C. § 112, first paragraph**

**Written description**

The Examiner alleges that the specification does not adequately describe polypeptides comprising peptides with 75-99 % identity with SEQ ID NO 245, 297, 298 and 301 as claimed. Applicants respectfully disagree. As stated, the functional equivalents are variants having at least 75 % sequence identity to the peptides identified by the SEQ ID NOs listed. This level of sequence identity to the peptides identified by SEQ ID NOs is maintained to help ensure that the antigenic properties of the peptides are conserved. The Skolnick reference cited by the examiner as support for the inaccuracy of "assigning functional activities for any particular protein or protein family based upon sequence homology" is not relevant in this connection due to the fact that peptides of 9-15 amino acids in length are almost certain to have no folding or other significant tertiary structure, and therefore are not proteins with functional activities as discussed by Skolnick. Skolnick's advocacy of the greater importance of the chemical structure of side chains relative to exact sequence information, actually supports the fact that homologous peptides may be predicted to induce similar T-cell responses, especially given the molecular nature of peptide-HLA/MHC binding. The remaining references cited by the examiner discuss particular amino acid substitutions in an assortment of proteins whose function is abolished or inhibited by such mutations. As discussed above, this is not relevant for the present claim, as protein activity can not be compared with antigenic activity or HLA/MHC binding of a peptide. Applicants submit that the application does not lack written description for polypeptides comprising peptides having 75-99 % identity to peptides identified by SEQ ID NO 245, 297, 298 and 301, and respectfully request withdrawal of this rejection.

**Appl. No.** : **10/553,078**  
**Filed** : **June 23, 2006**

Applicants further note that the antigenic peptides of SEQ ID NOs 245 and 297 themselves are, in one sense, 90% identical to each other by virtue of the presence or absence of the C-terminal valine.

The examiner concludes the rejection by stating that “undue experimentation would be required to reasonably predict that a peptide vaccine would induce an active T-cell response in an individual.” The present invention relates to the use of specific peptides derived from a highly specific cancer antigen for which spontaneous T-cell responses have been detected in cancer patients using ELISPOT assays. These *in vitro* data are provided in the application as evidence supporting the functionality of the claimed invention. A correlation between activity in ELISPOT assays and T-cell responses *in vivo* exists in the literature, as can be seen in the references cited above. Methods for assessing HLA binding activity or T-cell response-inducing activity of a peptide in an ELISPOT assay are described in the application and can be performed with out undue experimentation by a skilled artisan. Thus, Applicants respectfully submit that no undue experimentation is required to practice the claimed methods.

#### Novelty and non-obviousness

Applicants acknowledge and appreciate the Examiner’s confirmation of novelty and non-obviousness of the Claims 45 and 54-59.

#### **CONCLUSION**

Applicants have endeavored to address all of the Examiner’s concerns as expressed in the outstanding Office Action. Accordingly, arguments in support of the patentability of the pending claim set are presented above. In light of the above amendments and remarks, reconsideration and withdrawal of the outstanding rejections is specifically requested. If the Examiner finds any remaining impediment to the prompt allowance of these claims that could be clarified with a telephone conference, the Examiner is respectfully requested to initiate the same with the undersigned.

**APPENDIX A: MARKED COPY OF SUBSTITUTE SPECIFICATION****Therapeutic Cancer Vaccine**

- 5 All patent and non-patent references cited in this patent application are hereby incorporated by reference in their entirety.

**Field of the Invention**

- 10 The present invention relates to fragments of ML-IAP (livin) and a therapeutic vaccine comprising one or more ML-IAP polypeptide fragments. The vaccine can be used for prophylactic, ameliorating and/or curative treatment of e.g. cancers and auto-immune diseases.

15 **Background of the Invention**

- It is well established that peptide epitopes derived from human tumor-associated antigens (TAA) can be recognized by cytotoxic T lymphocytes (CTL) in the context of MHC molecules <sup>1</sup> and that most - if not all - tumors express such antigens. Consequently, exciting clinical efforts are ongoing to target these TAA in strategies such as vaccination and adoptive T cell therapy in order to generate effective anti-tumor CTL responses in patients <sup>2-5</sup>.
- 20

- For melanoma, the tumor for which the largest number of CTL defined TAA have been characterized, powerful CTL responses against antigens have been induced by vaccination and some patients have experienced a complete remission of their disease <sup>6,7</sup>.
- 25

- However, immunoselection of antigen loss variants can be a serious obstacle for the curative potential of most of the known CTL epitopes in clinical oncology, and the selection of antigen deficient mutant tumors is a well-recognized limitation in therapeutic strategies when targeting antigens that do not have a role in cancer growth <sup>5,27,28</sup>. The reason is that most characterized peptides are derived from polypeptides, which are not essential for the survival of the tumor cell. Thus, if powerful CTL responses are induced against these peptide antigens by therapeutical measures
- 30
- 35

such as vaccinations, tumor cells lacking the expression of the targeted antigen are very likely to escape the raised immune responses<sup>8,9</sup>.

5 There is a need for more efficient therapeutical vaccines and improved methods of treatment of cancer and autoimmune diseases.

### Summary of the Invention

10 The therapeutical application of tumor antigens the expression of which is essential for the survival of tumor cells represents a strategy for cancer treatment by preventing antigen loss variants from emerging due to immunoselection, particularly during immune therapy. However, the identification of specific fragments, which comprise good antigenic properties is difficult.

15 The inhibitor of apoptosis protein (IAP) family<sup>12</sup> represents one example of tumor antigens the expression of which is essential for the survival of tumor cells. Inhibition of apoptosis both enhances the survival of cancer cells and prevents the cancer cells from escaping from immune surveillance and cytotoxic therapies.

20 A number of different IAPs have been described. Their different expression patterns suggest an organ-specific role in promoting cell survival during development and tissue homeostasis. While X-IAP, C-IAP1 and C-IAP2 are relatively ubiquitously expressed, survivin is expressed only in fetal and tumor tissues.

25 The inhibitor of apoptosis polypeptide ML-IAP has a rather selective expression pattern, as it is predominantly detected in melanomas and a few other tissues<sup>13,14</sup>. The only other IAP with well-documented expression in melanoma is survivin.

30 ML-IAP can be detected in the majority of melanoma cell lines tested but not in normal melanocytes<sup>14</sup>. Melanoma cell lines with high levels of ML-IAP are more resistant to drug-induced apoptosis than are normal primary melanocytes. Thus, ML-IAP might be a critical cellular factor and increased expression levels of ML-IAP confer resistance to apoptotic stimuli, thereby contributing to the pathogenesis and progression of malignant melanomas.

35

The polypeptide ML-IAP inhibits apoptosis and cell death induced by death receptors and chemotherapeutic agents can thus be expected to be hampered by expression of ML-IAP.

5      Accordingly, elevated expression of ML-IAP renders melanoma cells resistant to apoptotic stimuli and thereby potentially contributes to the pathogenesis of this malignancy.

10      The present invention demonstrates that T-cells infiltrating the tumor environment or circulating in the peripheral blood of melanoma patients specifically recognize ML-IAP derived peptides. Thus, ML-IAP is on the one hand important for the survival of the cancer cell and on the other hand a target for immunological effector cells.

15      The present invention is in one aspect directed to fragments of ML-IAP (SEQ ID NO:1) capable of eliciting a specific T-cell response.

20      In another preferred aspect the present invention is directed to a therapeutic vaccine comprising ML-IAP (SEQ ID NO:1), and/or one or more fragments of ML-IAP (SEQ ID NO:1) capable of eliciting a specific T-cell response, including a response involving the activation of cytotoxic T-cells and/or T helper (Th) cells. The vaccine composition preferably further comprises an adjuvant and/or a carrier.

25      In yet another aspect there is provided a pharmaceutical composition comprising ML-IAP (SEQ ID NO:1), and/or one or more fragments of ML-IAP (SEQ ID NO:1) capable of eliciting a specific T-cell response, including a response involving the activation of cytotoxic T-cells and/or T helper (Th) cells, and a bioactive compound selected from the group consisting of a chemotherapeutic agent, an immunotherapeutic agent, and a second cancer vaccine composition. The pharmaceutical composition can further comprise an adjuvant and/or a carrier.

30      In a still further aspect of the invention there is provided a kit-of-parts comprising ML-IAP (SEQ ID NO:1), and/or one or more fragments of ML-IAP (SEQ ID NO:1) capable of eliciting a specific T-cell response, including a response involving the activation of cytotoxic T-cells and/or T helper (Th) cells, and a bioactive compound  
35      selected from the group consisting of a chemotherapeutic agent, an immunothera-

peutic agent, and a second cancer vaccine composition, wherein the one or more fragments of ML-IAP (SEQ ID NO:1) capable of eliciting a specific T-cell response and the bioactive compound selected from the group consisting of a chemotherapeutic agent, an immunotherapeutic agent, and a cancer vaccine can be administered simultaneously, or sequentially in any order. The kit-of-parts can optionally comprise a manual comprising information on the dosage regime or the administration of the ML-IAP fragment and the bioactive compound.

In yet another aspect of the invention there is provided a method for treatment of a human or animal body, wherein said method comprises the step of administering to an individual in need of said treatment the pharmaceutical composition or the components of the kit-of-parts according to the invention.

In a still further aspect of the invention there is provided the use of a fragment of ML-IAP in the manufacture of a vaccine composition capable of raising a specific T-cell response in an individual to which the vaccine composition has been administered.

In yet another aspect of the invention there is provided the use of a fragment of ML-IAP in combination with a bioactive agent in the manufacture of a pharmaceutical composition for treatment of a cancer and/or an auto-immune disease in an individual in need of said treatment.

In a still further aspect of the invention there is provided a method for activating and expanding T-cells specific for ML-IAP or fragments thereof, said method comprising the steps of co-cultivating T-cells and ML-IAP, and/or at least one fragment thereof, thereby activating the T-cells, and isolating activated ML-IAP specific T-cells and/or ML-IAP fragment specific T-cells.

In yet another aspect of the invention there is provided a method for treating an individual diagnosed with a cancer, or at risk of developing a cancer, said method comprising the steps of administering to said individual at least one isolated and activated ML-IAP specific T-cell, and/or at least one isolated and activated ML-IAP fragment specific T-cell.

## Brief Description of the Figures

### Figure 1

T-cell response against the ML-IAP<sub>280</sub> (QLCPICRAPV) peptide as measured in an ELISPOT in PBL from the melanoma patient FM3 (Figure 1A) or FM72 (Figure 1B) and in TIL from the melanoma patient PM9 (Figure 1C) or FM72 (Figure 1D). T-lymphocytes were stimulated once with peptide before plated at  $3 \times 10^5$  cells per well in duplicates either without or with peptide. The average number of peptide specific spots (after subtraction of spots without added peptide) was calculated for each patient using a CCD scanning device and a computer system (Figure 1E).

### Figure 2

T-cell response as measured in ELISPOT against the peptides ML-IAP<sub>280</sub> (QLCPICRAPV), MLIAP<sub>245</sub> (RLQEERTCKV), MLIAP<sub>230</sub> (VLEPPGARDV), and MLIAP<sub>90</sub> (RLASFYDWPL) in TIL samples from nine patients and in PBL from two patients. T-lymphocytes were stimulated once with peptide before plated at  $3 \times 10^5$  cells per well in duplicates either without or with peptide. The average number of peptide specific spots (after subtraction of spots without added peptide) was calculated for each patient using a CCD scanning device and a computer system.

### Figure 3

T-cell response against the ML-IAP<sub>245-253</sub> (RLQEERTCK) peptide as measured in an ELISPOT in PBL from 14 melanoma patients. T-lymphocytes were stimulated once with peptide before plated in triplicates either without or with peptide. The average number of peptide specific cells (after subtraction of spots without added peptide) was calculated for each patient as the number of spot forming cells per  $10^5$  CD8 positive cells after subtraction of the number of background spots formed without addition of peptide using the ImmunoSpot® Series 2.0 Analyzer (CTL Analyzers, LLC, Cleveland, US).

### Figure 4

*In situ* detection of ML-IAP-reactive CTL. Confocal laser scanning microscopy was used to detect CTL reacting with a Cy3-conjugated anti-CD8 antibody (red channel) and a fluorescein isothiocyanate-conjugated multimeric HLA-A2/ML-IAP<sub>280</sub> construct (green channel) (first and second columns) or with a fluorescein isothiocyanate con-

jugated multimeric HLA-A2/ML-IAP<sub>245</sub> construct (last column) in primary tumors from two HLA-A2-positive melanoma patients.

#### Figure 5

5 Cytolytic capacity of ML-IAP-specific CTL. ML-IAP<sub>245</sub>-reactive CTL were isolated from PBL from the melanoma patients CmelE22 using peptide-coated magnetic beads before being plated at  $2 \times 10^3$  cells per well in duplicates either with T2 cells without or pulsed with ML-IAP<sub>245</sub> (RLQEERTCKV) (Figure 5A). ML-IAP<sub>280</sub>-reactive CTL were isolated from a melanoma-infiltrated lymph node from patient Cmel72  
10 using peptide-coated magnetic beads. These cells were analyzed for specific lysis of T2 cells with (*square*) or without (*triangle*) ML-IAP<sub>280</sub> peptide (QLCPICRAPV) (Figure 5B). Lysis by ML-IAP<sub>280</sub>-isolated T cells of the autologous melanoma cell line FM93 (*triangle*), the HLA-A2 negative cell line FM56 (*black circle*) and the natural killer target cell line K562 (*white circle*) (Figure 5C).

15

#### **Detailed Description of the Invention**

Preferred embodiments of the present invention is disclosed herein below.

20 Fragments of ML-IAP and therapeutical vaccine compositions comprising such fragments or full-length ML-IAP

In preferred embodiments the present invention is directed to fragments of ML-IAP and therapeutical vaccine compositions comprising one or more fragments of ML-IAP, and a pharmaceutically acceptable carrier. The vaccine composition can further  
25 comprise a carrier and/or an adjuvant compound. A vaccine composition comprising full-length ML-IAP (SEQ ID NO:1) is also provided.

Preferred fragments of consecutive ML-IAP amino acid residues according to the present invention are listed herein below. The fragments can be selected from the sequence of amino acid residues of full-length ML-IAP listed herein below as SEQ ID NO:1:

35 mgpkdsakcl hrgpqshwa agdgptqerc gprslgspvl gldtcrawdh vdgqilgqlr plteeeeeeg  
agatlsrgpa fpgmgseelr lasfydwpld aevppellaa agffhtghqd kvrcffcygg lqswkrgddp

wthakwfpssc qflrskgrd fvhsqeths qlgswdpwe epedaapvap svpasgypel ptprrrevqse  
 saqepggvsp aeaqrawwvl eppgardvea qlrlqeert ckvcldravs ivfvpghlv caecapglql  
 cpicrapvrs rvrtfls (SEQ ID NO:1).

5 It is not possible to readily predict which fragments of a given polypeptide, such as  
 ML-IAP will constitute good antigens or efficient targets for spontaneous CTL re-  
 sponses. Thus, it is critical to identify peptides, which are suitable as antigens. The  
 present invention provides methods for testing fragments of ML-IAP, i.e. tests for  
 binding affinity to HLA molecules, elicited CTL response and/or any other antigenic  
 10 properties to identify those fragments of ML-IAP which constitute good antigens.  
 Furthermore, the invention provides useful ML-IAP peptides.

The binding of peptides to the MHC is a crucial step in the generation of a T cell  
 response. Thus, a commonly used way of identifying CTL epitopes is the use of so-  
 15 sophisticated algorithms, which incorporate information about the contribution of all  
 peptide side-chains to the overall binding of a particular peptide in an attempt to  
 improve the prediction of CTL epitopes. However, firstly it has been described that  
 there is no strong correlation between actual and predicted peptide binding to MHC  
 from computer algorithms (20). Secondly, peptide binding to MHC is one of a num-  
 20 ber of different factors which determine the immunogenicity of a given peptide.  
 These include expression level of the relevant source protein, processing, TAP-  
 transport, expression level of the class I MHC on the cell surface, TCR repertoire,  
 CTL sensitivity, immuno-suppression and cytokines (23). Thus, there are many fac-  
 tors, which determine a CTL response against a given peptide. Furthermore, many  
 25 immunodominant epitopes in CTL responses to self proteins may frequently be sub-  
 dominant or cryptic, rather than dominant determinants. The identification of CTL  
 epitopes from a given protein is therefore a complicated manner.

30 Fragments comprising a sequence of 9 consecutive amino acid residues of ML-IAP

The present invention in one preferred embodiment is directed to fragments of ML-  
 IAP comprising at least 9 consecutive amino acid residues and vaccine composi-  
 tions comprising fragments of ML-IAP comprising at least 9 consecutive amino acid  
 35 residues, including the fragments listed herein below:

mgpkdsakc (SEQ ID NO:2); gpkdsakcl (SEQ ID NO:3); pkdsakclh (SEQ ID NO:4);  
kdsakclhr (SEQ ID NO:5); dsakclhrg (SEQ ID NO:6); sakclhrgp (SEQ ID NO:7);  
akclhrgpq (SEQ ID NO:8); kclhrgpqp (SEQ ID NO:9); clhrgpqps (SEQ ID NO:10);  
5 lhrgpqpsh (SEQ ID NO:11); hrgpqpshw (SEQ ID NO:12); rgpqpshwa (SEQ ID  
NO:13); gpqpshwaa (SEQ ID NO:14); pqpshwaag (SEQ ID NO:15); qpshwaagd  
(SEQ ID NO:16); pshwaagd (SEQ ID NO:17); shwaagdgp (SEQ ID NO:18);  
hwaagdgp (SEQ ID NO:19); waagdgp (SEQ ID NO:20); aagdgp (SEQ ID  
NO:21); agdgp (SEQ ID NO:22); gdgp (SEQ ID NO:23); dgdp (SEQ ID  
10 NO:24); gdp (SEQ ID NO:25); dp (SEQ ID NO:26); p (SEQ ID  
NO:27); (SEQ ID NO:28); (SEQ ID NO:29); (SEQ ID  
NO:30); (SEQ ID NO:31); (SEQ ID NO:32); (SEQ ID  
NO:33); (SEQ ID NO:34); (SEQ ID NO:35); (SEQ ID  
NO:36); (SEQ ID NO:37); (SEQ ID NO:38); (SEQ ID  
15 NO:39); (SEQ ID NO:40); (SEQ ID NO:41); (SEQ ID  
NO:42); (SEQ ID NO:43); (SEQ ID NO:44); (SEQ ID  
NO:45); (SEQ ID NO:46); (SEQ ID NO:47); (SEQ ID  
NO:48); (SEQ ID NO:49); (SEQ ID NO:50); (SEQ ID  
ID NO:51); (SEQ ID NO:52); (SEQ ID NO:53); (SEQ ID  
20 NO:54); (SEQ ID NO:55); (SEQ ID NO:56); (SEQ ID  
NO:57); (SEQ ID NO:58); (SEQ ID NO:59); (SEQ ID

 ID NO:284); crapvrsrv (SEQ ID NO:285); rapvrsrvr (SEQ ID NO:286); apvrsrvrt  
 (SEQ ID NO:287); pvrsvrtrf (SEQ ID NO:288); vrsrvtrfl (SEQ ID NO:289); rsvrtrfls  
 (SEQ ID NO:290).

In one embodiment of the present invention the fragment is preferably not SEQ ID NO:35.

Fragments comprising a sequence of 10 consecutive amino acid residues of ML-IAP

5

The present invention also relates to fragments comprising or consisting of 10 consecutive amino acid residues of ML-IAP (SEQ ID NO:1), such as e.g. the 10 most N-terminal amino acid residues of SEQ ID NO:1, i.e. mgpkdsakcl (SEQ ID NO:291), as well as vaccine compositions comprising such fragments. Additional fragments comprising or consisting of 10 consecutive amino acid residues of ML-IAP can thus be obtained in the following way:

selecting any one of the above fragments defined by SEQ ID NO:3 to SEQ ID NO:289 (i.e. a fragment listed above defined by SEQ ID NO:N, wherein N is an integer larger than 2 and smaller than 290), and

adding the C-terminal amino acid residue of SEQ ID NO:N+1 to the C-terminal amino acid residue of the fragment selected in step i).

In one embodiment of the present invention the fragment is preferably not SEQ ID NO:299.

Fragments comprising a sequence of 11 consecutive amino acid residues of ML-IAP

The present invention also relates to fragments comprising or consisting of 11 consecutive amino acid residues of ML-IAP (SEQ ID NO:1), such as e.g. the 11 most N-terminal amino acid residues of SEQ ID NO:1, i.e. mgpkdsakclh (SEQ ID NO:292), as well as vaccine compositions comprising such fragments. Additional fragments comprising or consisting of 11 consecutive amino acid residues of ML-IAP can thus be obtained in the following way:

selecting any one of the above fragments defined by SEQ ID NO:3 to SEQ ID NO:288 (i.e. a fragment listed above defined by SEQ ID NO:N, wherein N is an integer larger than 2 and smaller than 289), and

35

adding the 2 most C-terminal amino acid residues of SEQ ID NO:N+2 to the C-terminal amino acid residue of the fragment selected in step i).

Fragments comprising a sequence of 12 consecutive amino acid residues of ML-IAP

5

The present invention also relates to fragments comprising or consisting of 12 consecutive amino acid residues of ML-IAP (SEQ ID NO:1), such as e.g. the 12 most N-terminal amino acid residues of SEQ ID NO:1, i.e. mgpkdsakclhr (SEQ ID NO:293), as well as vaccine compositions comprising such fragments. Additional fragments comprising or consisting of 12 consecutive amino acid residues of ML-IAP can thus be obtained in the following way:

10

selecting any one of the above fragments defined by SEQ ID NO:3 to SEQ ID NO:287 (i.e. a fragment listed above defined by SEQ ID NO:N, wherein N is an integer larger than 2 and smaller than 288), and

15

adding the 3 most C-terminal amino acid residues of SEQ ID NO:N+3 to the C-terminal amino acid residue of the fragment selected in step i).

20 Fragments comprising a sequence of 13 consecutive amino acid residues of ML-IAP

The present invention also relates to fragments comprising or consisting of 13 consecutive amino acid residues of ML-IAP (SEQ ID NO:1), such as e.g. the 13 most N-terminal amino acid residues of SEQ ID NO:1, i.e. mgpkdsakclhrg (SEQ ID NO:294), as well as vaccine compositions comprising such fragments. Additional fragments comprising or consisting of 13 consecutive amino acid residues of ML-IAP can thus generally be obtained in the following way:

25

selecting any one of the above fragments defined by SEQ ID NO:3 to SEQ ID NO:286 (i.e. a fragment listed above defined by SEQ ID NO:N, wherein N is an integer larger than 2 and smaller than 287), and

30

adding the 4 most C-terminal amino acid residues of SEQ ID NO:N+4 to the C-terminal amino acid residue of the fragment selected in step i).

35

Fragments comprising a sequence of 14 consecutive amino acid residues of ML-IAP

The present invention also relates to fragments comprising or consisting of 14 consecutive amino acid residues of ML-IAP (SEQ ID NO:1), such as e.g. the 14 most N-terminal amino acid residues of SEQ ID NO:1, i.e. mgpkdsakclhrgp (SEQ ID NO:295), as well as vaccine compositions comprising such fragments. Additional fragments comprising or consisting of 14 consecutive amino acid residues of ML-IAP can thus generally be obtained in the following way:

selecting any one of the above fragments defined by SEQ ID NO:3 to SEQ ID NO:285 (i.e. a fragment listed above defined by SEQ ID NO:N, wherein N is an integer larger than 2 and smaller than 286), and

adding the 5 most C-terminal amino acid residues of SEQ ID NO:N+5 to the C-terminal amino acid residue of the fragment selected in step i).

Fragments comprising a sequence of 15 consecutive amino acid residues of ML-IAP

The present invention also relates to fragments comprising or consisting of 15 consecutive amino acid residues of ML-IAP (SEQ ID NO:1), such as e.g. the 15 most N-terminal amino acid residues of SEQ ID NO:1, i.e. mgpkdsakclhrqp (SEQ ID NO:296), as well as vaccine compositions comprising such fragments. Additional fragments comprising or consisting of 15 consecutive amino acid residues of ML-IAP can thus generally be obtained in the following way:

selecting any one of the above fragments defined by SEQ ID NO:3 to SEQ ID NO:284 (i.e. a fragment listed above defined by SEQ ID NO:N, wherein N is an integer larger than 2 and smaller than 285), and

adding the 6 most C-terminal amino acid residues of SEQ ID NO:N+6 to the C-terminal amino acid residue of the fragment selected in step i).

Accordingly, for any of the above fragments of ML-IAP comprising or consisting of from 10 to 15 consecutive amino acid residues of ML-IAP, N is an integer of from 3 to preferably less than 290, such as 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17,

18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100, 101, 102, 103, 104, 105, 106, 107, 108, 109, 110, 111, 112, 113, 114, 115, 116, 117, 118, 119, 120, 121, 122, 123, 124, 125, 126, 127, 128, 129, 130, 131, 132, 133, 134, 135, 136, 137, 138, 139, 140, 141, 142, 143, 144, 145, 146, 147, 148, 149, 150, 151, 152, 153, 154, 155, 156, 157, 158, 159, 160, 161, 162, 163, 164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 188, 189, 190, 191, 192, 193, 194, 195, 196, 197, 198, 199, 200, 201, 202, 203, 204, 205, 206, 207, 208, 209, 210, 211, 212, 213, 214, 215, 216, 217, 218, 219, 220, 221, 222, 223, 224, 225, 226, 227, 228, 229, 230, 231, 232, 233, 234, 235, 236, 237, 238, 239, 240, 241, 242, 243, 244, 245, 246, 247, 248, 249, 250, 251, 252, 253, 254, 255, 256, 257, 258, 259, 260, 261, 262, 263, 264, 265, 266, 267, 268, 269, 270, 271, 272, 273, 274, 275, 276, 277, 278, 279, 280, 281, 282, 283, 284 (fragments comprising or consisting of 15 or less consecutive amino acid residues of ML-IAP), 285 (fragments comprising or consisting of 14 or less consecutive amino acid residues of ML-IAP), 286 (fragments comprising or consisting of 13 or less consecutive amino acid residues of ML-IAP), 287 (fragments comprising or consisting of 12 or less consecutive amino acid residues of ML-IAP), 288 (fragments comprising or consisting of 11 or less consecutive amino acid residues of ML-IAP), 289 (fragments comprising or consisting of 10 or less consecutive amino acid residues of ML-IAP).

Accordingly, in preferred embodiments the present invention is directed to fragments of ML-IAP comprising or consisting of more than 9 consecutive amino acid residues. Such fragments can comprise for example 10 amino acid residues, such as 11 amino acid residues, for example 12 amino acid residues, such as 13 amino acid residues, for example 14 amino acid residues, such as 15 amino acid residues, for example 16 amino acid residues, such as 17 amino acid residues, for example 18 amino acid residues, such as 19 amino acid residues, for example 20 amino acid residues, such as 21 amino acid residues, for example 22 amino acid residues, such as 23 amino acid residues, for example 24 amino acid residues, such as 25 amino acid residues, for example 26 amino acid residues, such as 27 amino acid residues, for example 28 amino acid residues, such as 29 amino acid residues, for example

[illegible]

residues, for example 114 amino acid residues, such as 115 amino acid residues,  
for example 116 amino acid residues, such as 117 amino acid residues, for example  
118 amino acid residues, such as 119 amino acid residues, for example 120 amino  
acid residues, such as 121 amino acid residues, for example 122 amino acid resi-  
5 dues, such as 123 amino acid residues, for example 124 amino acid residues, such  
as 125 amino acid residues, for example 126 amino acid residues, such as 127  
amino acid residues, for example 128 amino acid residues, such as 129 amino acid  
residues, for example 130 amino acid residues, such as 131 amino acid residues,  
for example 132 amino acid residues, such as 133 amino acid residues, for example  
10 134 amino acid residues, such as 135 amino acid residues, for example 136 amino  
acid residues, such as 137 amino acid residues, for example 138 amino acid resi-  
dues, such as 139 amino acid residues, for example 140 amino acid residues, such  
as 141 amino acid residues, for example 142 amino acid residues, such as 143  
amino acid residues, for example 144 amino acid residues, such as 145 amino acid  
15 residues, for example 146 amino acid residues, such as 147 amino acid residues,  
for example 148 amino acid residues, such as 149 amino acid residues, for example  
150 amino acid residues, such as 151 amino acid residues, for example 152 amino  
acid residues, such as 153 amino acid residues, for example 154 amino acid resi-  
dues, such as 155 amino acid residues, for example 156 amino acid residues, such  
20 as 157 amino acid residues, for example 158 amino acid residues, such as 159  
amino acid residues, for example 160 amino acid residues, such as 161 amino acid  
residues, for example 162 amino acid residues, such as 163 amino acid residues,  
for example 164 amino acid residues, such as 165 amino acid residues, for example  
166 amino acid residues, such as 167 amino acid residues, for example 168 amino  
25 acid residues, such as 169 amino acid residues, for example 170 amino acid resi-  
dues, such as 171 amino acid residues, for example 172 amino acid residues, such  
as 173 amino acid residues, for example 174 amino acid residues, such as 175  
amino acid residues, for example 176 amino acid residues, such as 177 amino acid  
residues, for example 178 amino acid residues, such as 179 amino acid residues,  
30 for example 180 amino acid residues, such as 181 amino acid residues, for example  
182 amino acid residues, such as 183 amino acid residues, for example 184 amino  
acid residues, such as 185 amino acid residues, for example 186 amino acid resi-  
dues, such as 187 amino acid residues, for example 188 amino acid residues, such  
as 189 amino acid residues, for example 190 amino acid residues, such as 191  
35 amino acid residues, for example 192 amino acid residues, such as 193 amino acid

residues, for example 194 amino acid residues, such as 195 amino acid residues,  
for example 196 amino acid residues, such as 197 amino acid residues, for example  
198 amino acid residues, such as 199 amino acid residues, for example 200 amino  
acid residues, such as 201 amino acid residues, for example 202 amino acid resi-  
5 dues, such as 203 amino acid residues, for example 204 amino acid residues, such  
as 205 amino acid residues, for example 206 amino acid residues, such as 207  
amino acid residues, for example 208 amino acid residues, such as 209 amino acid  
residues, for example 210 amino acid residues, such as 211 amino acid residues,  
for example 212 amino acid residues, such as 213 amino acid residues, for example  
10 214 amino acid residues, such as 215 amino acid residues, for example 216 amino  
acid residues, such as 217 amino acid residues, for example 218 amino acid resi-  
dues, such as 219 amino acid residues, for example 220 amino acid residues, such  
as 221 amino acid residues, for example 222 amino acid residues, such as 223  
amino acid residues, for example 224 amino acid residues, such as 225 amino acid  
15 residues, for example 226 amino acid residues, such as 227 amino acid residues,  
for example 228 amino acid residues, such as 229 amino acid residues, for example  
230 amino acid residues, such as 231 amino acid residues, for example 232 amino  
acid residues, such as 233 amino acid residues, for example 234 amino acid resi-  
dues, such as 235 amino acid residues, for example 236 amino acid residues, such  
20 as 237 amino acid residues, for example 238 amino acid residues, such as 239  
amino acid residues, for example 240 amino acid residues, such as 241 amino acid  
residues, for example 242 amino acid residues, such as 243 amino acid residues,

262 amino acid residues, such as 263 amino acid residues, for example 264 amino  
acid residues, such as 265 amino acid residues, for example 266 amino acid resi-  
dues, such as 267 amino acid residues, for example 268 amino acid residues, such  
as 269 amino acid residues, for example 270 amino acid residues, such as 271  
35 amino acid residues, for example 272 amino acid residues, such as 273 amino acid

residues, for example 274 amino acid residues, such as 275 amino acid residues, for example 276 amino acid residues, such as 277 amino acid residues, for example 278 amino acid residues, such as 279 amino acid residues, for example 280 amino acid residues, such as 281 amino acid residues, for example 282 amino acid residues, such as 283 amino acid residues, for example 284 amino acid residues, such as 285 amino acid residues, for example 286 amino acid residues, such as 287 amino acid residues, for example 288 amino acid residues, such as 289 amino acid residues, for example 290 amino acid residues, such as 291 amino acid residues, for example 292 amino acid residues, such as 293 amino acid residues, for example 294 amino acid residues, such as 295 amino acid residues, for example 296 amino acid residues,

wherein the most N-terminal amino acid residue of each of the above fragments is for example residue 1 of SEQ ID NO:1, such as residue 2 of SEQ ID NO:1, for example residue 3 of SEQ ID NO:1, such as residue 4 of SEQ ID NO:1, for example residue 5 of SEQ ID NO:1, such as residue 6 of SEQ ID NO:1, for example residue 7 of SEQ ID NO:1, such as residue 8 of SEQ ID NO:1, for example residue 9 of SEQ ID NO:1, such as residue 10 of SEQ ID NO:1, for example residue 11 of SEQ ID NO:1, such as residue 12 of SEQ ID NO:1, for example residue 13 of SEQ ID NO:1, such as residue 14 of SEQ ID NO:1, for example residue 15 of SEQ ID NO:1, such as residue 16 of SEQ ID NO:1, for example residue 17 of SEQ ID NO:1, such as residue 18 of SEQ ID NO:1, for example residue 19 of SEQ ID NO:1, such as residue 20 of SEQ ID NO:1, for example residue 21 of SEQ ID NO:1, such as residue 22 of SEQ ID NO:1, for example residue 23 of SEQ ID NO:1, such as residue 24 of SEQ ID NO:1, for example residue 25 of SEQ ID NO:1, such as residue 26 of SEQ ID NO:1, for example residue 27 of SEQ ID NO:1, such as residue 28 of SEQ ID NO:1, for example residue 29 of SEQ ID NO:1, such as residue 30 of SEQ ID NO:1, for example residue 31 of SEQ ID NO:1, such as residue 32 of SEQ ID NO:1, for example residue 33 of SEQ ID NO:1, such as residue 34 of SEQ ID NO:1, for example residue 35 of SEQ ID NO:1, such as residue 36 of SEQ ID NO:1, for example residue 37 of SEQ ID NO:1, such as residue 38 of SEQ ID NO:1, for example residue 39 of SEQ ID NO:1, such as residue 40 of SEQ ID NO:1, for example residue 41 of SEQ ID NO:1, such as residue 42 of SEQ ID NO:1, for example residue 43 of SEQ ID NO:1, such as residue 44 of SEQ ID NO:1, for example residue 45 of SEQ ID NO:1, such as residue 46 of SEQ ID NO:1, for example residue 47 of SEQ

ID NO:1, such as residue 48 of SEQ ID NO:1, for example residue 49 of SEQ ID NO:1, such as residue 50 of SEQ ID NO:1, for example residue 51 of SEQ ID NO:1, such as residue 52 of SEQ ID NO:1, for example residue 53 of SEQ ID NO:1, such as residue 54 of SEQ ID NO:1, for example residue 55 of SEQ ID NO:1, such as residue 56 of SEQ ID NO:1, for example residue 57 of SEQ ID NO:1, such as residue 58 of SEQ ID NO:1, for example residue 59 of SEQ ID NO:1, such as residue 60 of SEQ ID NO:1, for example residue 61 of SEQ ID NO:1, such as residue 62 of SEQ ID NO:1, for example residue 63 of SEQ ID NO:1, such as residue 64 of SEQ ID NO:1, for example residue 65 of SEQ ID NO:1, such as residue 66 of SEQ ID NO:1, for example residue 67 of SEQ ID NO:1, such as residue 68 of SEQ ID NO:1, for example residue 69 of SEQ ID NO:1, such as residue 70 of SEQ ID NO:1, for example residue 71 of SEQ ID NO:1, such as residue 72 of SEQ ID NO:1, for example residue 73 of SEQ ID NO:1, such as residue 74 of SEQ ID NO:1, for example residue 75 of SEQ ID NO:1, such as residue 76 of SEQ ID NO:1, for example residue 77 of SEQ ID NO:1, such as residue 78 of SEQ ID NO:1, for example residue 79 of SEQ ID NO:1, such as residue 80 of SEQ ID NO:1, for example residue 81 of SEQ ID NO:1, such as residue 82 of SEQ ID NO:1, for example residue 83 of SEQ ID NO:1, such as residue 84 of SEQ ID NO:1, for example residue 85 of SEQ ID NO:1, such as residue 86 of SEQ ID NO:1, for example residue 87 of SEQ ID NO:1, such as residue 88 of SEQ ID NO:1, for example residue 89 of SEQ ID NO:1, such as residue 90 of SEQ ID NO:1, for example residue 91 of SEQ ID NO:1, such as residue 92 of SEQ ID NO:1, for example residue 93 of SEQ ID NO:1, such as residue 94 of SEQ ID NO:1, for example residue 95 of SEQ ID NO:1, such as residue 96 of SEQ ID NO:1, for example residue 97 of SEQ ID NO:1, such as residue 98 of SEQ ID NO:1, for example residue 99 of SEQ ID NO:1, such as residue 100 of SEQ ID NO:1, for example residue 101 of SEQ ID NO:1, such as residue 102 of SEQ ID NO:1, for example residue 103 of SEQ ID NO:1, such as residue 104 of SEQ ID NO:1, for example residue 105 of SEQ ID NO:1, such as residue 106 of SEQ ID NO:1, for example residue 107 of SEQ ID NO:1, such as residue 108 of SEQ ID NO:1, for example residue 109 of SEQ ID NO:1, such as residue 110 of SEQ ID NO:1, for example residue 111 of SEQ ID NO:1, such as residue 112 of SEQ ID NO:1, for example residue 113 of SEQ ID NO:1, such as residue 114 of SEQ ID NO:1, for example residue 115 of SEQ ID NO:1, such as residue 116 of SEQ ID NO:1, for example residue 117 of SEQ ID NO:1, such as residue 118 of SEQ ID NO:1, for example residue 119 of SEQ ID NO:1, such as residue 120 of SEQ ID

NO:1, for example residue 121 of SEQ ID NO:1, such as residue 122 of SEQ ID  
NO:1, for example residue 123 of SEQ ID NO:1, such as residue 124 of SEQ ID  
NO:1, for example residue 125 of SEQ ID NO:1, such as residue 126 of SEQ ID  
NO:1, for example residue 127 of SEQ ID NO:1, such as residue 128 of SEQ ID  
5 NO:1, for example residue 129 of SEQ ID NO:1, such as residue 130 of SEQ ID  
NO:1, for example residue 131 of SEQ ID NO:1, such as residue 132 of SEQ ID  
NO:1, for example residue 133 of SEQ ID NO:1, such as residue 134 of SEQ ID  
NO:1, for example residue 135 of SEQ ID NO:1, such as residue 136 of SEQ ID  
NO:1, for example residue 137 of SEQ ID NO:1, such as residue 138 of SEQ ID  
10 NO:1, for example residue 139 of SEQ ID NO:1, such as residue 140 of SEQ ID  
NO:1, for example residue 141 of SEQ ID NO:1, such as residue 142 of SEQ ID  
NO:1, for example residue 143 of SEQ ID NO:1, such as residue 144 of SEQ ID  
NO:1, for example residue 145 of SEQ ID NO:1, such as residue 146 of SEQ ID  
NO:1, for example residue 147 of SEQ ID NO:1, such as residue 148 of SEQ ID  
15 NO:1, for example residue 149 of SEQ ID NO:1, such as residue 150 of SEQ ID  
NO:1, for example residue 151 of SEQ ID NO:1, such as residue 152 of SEQ ID  
NO:1, for example residue 153 of SEQ ID NO:1, such as residue 154 of SEQ ID  
NO:1, for example residue 155 of SEQ ID NO:1, such as residue 156 of SEQ ID  
NO:1, for example residue 157 of SEQ ID NO:1, such as residue 158 of SEQ ID  
20 NO:1, for example residue 159 of SEQ ID NO:1, such as residue 160 of SEQ ID  
NO:1, for example residue 161 of SEQ ID NO:1, such as residue 162 of SEQ ID  
NO:1, for example residue 163 of SEQ ID NO:1, such as residue 164 of SEQ ID  
NO:1, for example residue 165 of SEQ ID NO:1, such as residue 166 of SEQ ID  
NO:1, for example residue 167 of SEQ ID NO:1, such as residue 168 of SEQ ID  
25 NO:1, for example residue 169 of SEQ ID NO:1, such as residue 170 of SEQ ID  
NO:1, for example residue 171 of SEQ ID NO:1, such as residue 172 of SEQ ID  
NO:1, for example residue 173 of SEQ ID NO:1, such as residue 174 of SEQ ID  
NO:1, for example residue 175 of SEQ ID NO:1, such as residue 176 of SEQ ID  
NO:1, for example residue 177 of SEQ ID NO:1, such as residue 178 of SEQ ID  
30 NO:1, for example residue 179 of SEQ ID NO:1, such as residue 180 of SEQ ID  
NO:1, for example residue 181 of SEQ ID NO:1, such as residue 182 of SEQ ID  
NO:1, for example residue 183 of SEQ ID NO:1, such as residue 184 of SEQ ID  
NO:1, for example residue 185 of SEQ ID NO:1, such as residue 186 of SEQ ID  
NO:1, for example residue 187 of SEQ ID NO:1, such as residue 188 of SEQ ID  
35 NO:1, for example residue 189 of SEQ ID NO:1, such as residue 190 of SEQ ID

NO:1, for example residue 191 of SEQ ID NO:1, such as residue 192 of SEQ ID  
NO:1, for example residue 193 of SEQ ID NO:1, such as residue 194 of SEQ ID  
NO:1, for example residue 195 of SEQ ID NO:1, such as residue 196 of SEQ ID  
NO:1, for example residue 197 of SEQ ID NO:1, such as residue 198 of SEQ ID  
5 NO:1, for example residue 199 of SEQ ID NO:1, such as residue 200 of SEQ ID  
NO:1, for example residue 201 of SEQ ID NO:1, such as residue 202 of SEQ ID  
NO:1, for example residue 203 of SEQ ID NO:1, such as residue 204 of SEQ ID  
NO:1, for example residue 205 of SEQ ID NO:1, such as residue 206 of SEQ ID  
NO:1, for example residue 207 of SEQ ID NO:1, such as residue 208 of SEQ ID  
10 NO:1, for example residue 209 of SEQ ID NO:1, such as residue 210 of SEQ ID  
NO:1, for example residue 211 of SEQ ID NO:1, such as residue 212 of SEQ ID  
NO:1, for example residue 213 of SEQ ID NO:1, such as residue 214 of SEQ ID  
NO:1, for example residue 215 of SEQ ID NO:1, such as residue 216 of SEQ ID  
NO:1, for example residue 217 of SEQ ID NO:1, such as residue 218 of SEQ ID  
15 NO:1, for example residue 219 of SEQ ID NO:1, such as residue 220 of SEQ ID  
NO:1, for example residue 221 of SEQ ID NO:1, such as residue 222 of SEQ ID  
NO:1, for example residue 223 of SEQ ID NO:1, such as residue 224 of SEQ ID  
NO:1, for example residue 225 of SEQ ID NO:1, such as residue 226 of SEQ ID  
NO:1, for example residue 227 of SEQ ID NO:1, such as residue 228 of SEQ ID  
20 NO:1, for example residue 229 of SEQ ID NO:1, such as residue 230 of SEQ ID  
NO:1, for example residue 231 of SEQ ID NO:1, such as residue 232 of SEQ ID  
NO:1, for example residue 233 of SEQ ID NO:1, such as residue 234 of SEQ ID  
NO:1, for example residue 235 of SEQ ID NO:1, such as residue 236 of SEQ ID  
NO:1, for example residue 237 of SEQ ID NO:1, such as residue 238 of SEQ ID  
25 NO:1, for example residue 239 of SEQ ID NO:1, such as residue 240 of SEQ ID  
NO:1, for example residue 241 of SEQ ID NO:1, such as residue 242 of SEQ ID  
NO:1, for example residue 243 of SEQ ID NO:1, such as residue 244 of SEQ ID  
NO:1, for example residue 245 of SEQ ID NO:1, such as residue 246 of SEQ ID  
NO:1, for example residue 247 of SEQ ID NO:1, such as residue 248 of SEQ ID  
30 NO:1, for example residue 249 of SEQ ID NO:1, such as residue 250 of SEQ ID  
NO:1, for example residue 251 of SEQ ID NO:1, such as residue 252 of SEQ ID  
NO:1, for example residue 253 of SEQ ID NO:1, such as residue 254 of SEQ ID  
NO:1, for example residue 255 of SEQ ID NO:1, such as residue 256 of SEQ ID  
NO:1, for example residue 257 of SEQ ID NO:1, such as residue 258 of SEQ ID  
35 NO:1, for example residue 259 of SEQ ID NO:1, such as residue 260 of SEQ ID

NO:1, for example residue 261 of SEQ ID NO:1, such as residue 262 of SEQ ID  
 NO:1, for example residue 263 of SEQ ID NO:1, such as residue 264 of SEQ ID  
 NO:1, for example residue 265 of SEQ ID NO:1, such as residue 266 of SEQ ID  
 NO:1, for example residue 267 of SEQ ID NO:1, such as residue 268 of SEQ ID  
 5 NO:1, for example residue 269 of SEQ ID NO:1, such as residue 270 of SEQ ID  
 NO:1, for example residue 271 of SEQ ID NO:1, such as residue 272 of SEQ ID  
 NO:1, for example residue 273 of SEQ ID NO:1, such as residue 274 of SEQ ID  
 NO:1, for example residue 275 of SEQ ID NO:1, such as residue 276 of SEQ ID  
 NO:1, for example residue 277 of SEQ ID NO:1, such as residue 278 of SEQ ID  
 10 NO:1, for example residue 279 of SEQ ID NO:1, such as residue 280 of SEQ ID  
 NO:1, for example residue 281 of SEQ ID NO:1, such as residue 282 of SEQ ID  
 NO:1, for example residue 283 of SEQ ID NO:1, such as residue 284 of SEQ ID  
 NO:1, for example residue 285 of SEQ ID NO:1, such as residue 286 of SEQ ID  
 NO:1, for example residue 287 of SEQ ID NO:1, such as residue 288 of SEQ ID  
 15 NO:1, for example residue 289 of SEQ ID NO:1, such as residue 290 of SEQ ID  
 NO:1, for example residue 291 of SEQ ID NO:1, such as residue 292 of SEQ ID  
 NO:1, for example residue 293 of SEQ ID NO:1, such as residue 294 of SEQ ID  
 NO:1, for example residue 295 of SEQ ID NO:1, such as residue 296 of SEQ ID  
 NO:1, for example residue 297 of SEQ ID NO:1,

20

with the proviso that the length of a given fragment, measured as the number of  
 amino acid residues, is shorter than or equal to the result obtained by subtracting  
 from 297 (the number of residues in the full-length ML-IAP sequence) the position  
 (number) in SEQ ID NO:1 of the N-terminal amino acid residue of the fragment in  
 25 question.

25

Much preferred fragments of ML-IAP are listed herein below in Table 1 and charac-  
 terised by their  $C_{50}$  value ( $\mu\text{M}$ ) as the concentration of the peptide required for half  
 maximal binding to HLA-A2. The value range listed in subscript indicates the posi-  
 30 tion of the first amino acid in the sequence.

30

Table 1

ML-IAP fragment	Sequence	$C_{50}$ ( $\mu\text{M}$ )
-----------------	----------	----------------------------

ML-IAP <sub>245</sub>	RLQEERTCKV (SEQ ID NO:297)	1
ML-IAP <sub>280</sub>	QLCPICRAPV (SEQ ID NO:298)	20
ML-IAP <sub>90</sub>	RLASFYDWPL (SEQ ID NO:299)	0.2
ML-IAP <sub>154</sub>	LLRSKGRDFV (SEQ ID NO:300)	10
ML-IAP <sub>230</sub>	VLEPPGARDV (SEQ ID NO:301)	>100
ML-IAP <sub>98</sub>	PLTAEVPPPEL (SEQ ID NO:302)	>100
ML-IAP <sub>261</sub>	SIVFVPCG	Not binding
ML-IAP <sub>34</sub>	SLGSPVLGL (SEQ ID NO:35)	1
ML-IAP <sub>54</sub>	QILGQLRPL (SEQ ID NO:55)	1
ML-IAP <sub>99</sub>	LTAEVPPPEL (SEQ ID NO:100)	0.9
ML-IAP <sub>83</sub>	GMGSEELRL (SEQ ID NO:84)	30
ML-IAP <sub>200</sub>	ELPTPRREV (SEQ ID NO:200)	Not binding

Very preferred ML-IAP polypeptide fragments

- 5 In one aspect the present invention relates to a polypeptide fragment capable of raising a specific T-cell response, said fragment comprising a peptide consisting of at least 9 consecutive amino acid residues of ML-IAP (SEQ ID NO:1), wherein said peptide is selected from the group consisting rlqeertck (SEQ ID NO:245), qilgqlrpl (SEQ ID NO:55), ltaevppel (SEQ ID NO:100), gmgseelrl (SEQ ID NO:84), elptprrev (SEQ ID NO:200), rlqeertckv (SEQ ID NO:297), qlcpicrapv (SEQ ID NO:298), llrskgrdfv (SEQ ID NO:300), vleppgardv (SEQ ID NO:301) and pltaevppel (SEQ ID NO:302); and wherein said polypeptide fragment comprises at the most 100 amino acids.
- 10

Preferably the polypeptide fragment comprises at the most 90, more preferably at the most 80, even more preferably at the most 70, yet more preferably at the most 60 even more preferably at the most 50, yet more preferably at the most 40, even more preferably at the most 30, yet more preferably at the most 20, even more preferably at the most 18, yet more preferably at the most 16, even more preferably at the most 15, yet more preferably at the most 14, even more preferably at the most 13, yet more preferably at the most 12, such as at the most 11, for example at the most 10, such as at the most 9 amino acids.

10

It is preferred that the polypeptide fragment comprises at least 9, such as at least 10, for example at least 11, such as at least 12, for example at least 13, such as at least 14, for example at least 15 consecutive amino acids of ML-IAP (SEQ ID:1). Thus the polypeptide fragment may consist of 9, such as 10, for example 11, such as 12, for example 13, such as 14, for example 15 consecutive amino acids of SEQ ID:1, comprising (SEQ ID NO:245), (SEQ ID NO:55), (SEQ ID NO:100), (SEQ ID NO:84), (SEQ ID NO:200), (SEQ ID NO:297), (SEQ ID NO:298), (SEQ ID NO:300), (SEQ ID NO:301) or (SEQ ID NO:302).

20

#### Functional characterisation of preferred ML-IAP fragments

Very preferred fragments of ML-IAP according to the present invention are fragments of ML-IAP capable of eliciting a specific T-cell response, which may be either a cytotoxic T-cell response or a helper T-cell response, but which preferably is a cytotoxic T-cell response. Several different state-of-the-art methods may be used to identify peptide fragments capable of eliciting a specific T-cell response. However, it is difficult to predict whether a given peptide will be capable of eliciting a specific T-cell response. Even though computer models may predict functional epitopes, experimental evidence is usually required in order to verify whether a predicted epitope indeed is a functional epitope. Even fragments that associate with MHC molecules with high affinity will not necessarily give rise to a T-cell response as determined by for example ELISPOT assay (see herein below) or in an individual.

35

Hence, in one embodiment of the present invention it is preferred that the ML-IAP fragments are capable of association with an MHC molecule, even more preferred

that the fragment is capable of association with a class I MHC molecule. Preferred MHC class I molecules are frequently occurring MHC class I molecules, for example the MHC class I molecules described herein below. Association between ML-IAP and an MHC molecule may for example be determined using the assembly assay  
5 described herein below.

Preferred, ML-IAP fragment according to the invention may be characterised by having a  $C_{50}$  value, measured as the concentration ( $\mu\text{M}$ ) of the polypeptide fragment required for half maximal binding to an MHC molecule, preferably to an MHC class I  
10 molecule, in the range of from 500 to 1000, such as in the range of 200 to 500, for example in the range of 100 to 200, such as in the range of 50 to 100, for example in range of 25 to 50, such as in the range of 10 to 25, for example in range of 5 to 10 such as in the range of 1 to 5, for example in range of 0,1 to 1 such as in the range of 0,05 to 0,1, for example less than 0.05. Said MHC class I molecule may be any  
15 MHC class I molecule, for example an HLA-A molecule, such as HLA-A2. Preferred MHC class I molecules are frequently occurring MHC class I molecules, for example the MHC class I molecules described herein below.

More preferred fragments of ML-IAP includes fragments of ML-IAP wherein the  $C_{50}$   
20 value is less than 1000  $\mu\text{M}$ , even more preferably less than 200  $\mu\text{M}$ , yet more preferably less than 100  $\mu\text{M}$ , yet even more preferably less than 75  $\mu\text{M}$ , even more preferably less than 50  $\mu\text{M}$ , yet more preferably less than 40  $\mu\text{M}$ , even more preferably less than 31  $\mu\text{M}$ , yet more preferably less than 25  $\mu\text{M}$ , even more preferably less than 10  $\mu\text{M}$ , yet more preferably less than 5  $\mu\text{M}$ , even more preferably less than 1  
25  $\mu\text{M}$ , yet more preferably less than 0,5  $\mu\text{M}$ , even more preferably less than 0,2  $\mu\text{M}$ , yet more preferably less than 0,1  $\mu\text{M}$ , even more preferably less than 0,05  $\mu\text{M}$ , wherein the  $C_{50}$  value is the concentration of the peptide required for half maximal binding to an MHC molecule, preferably to an MHC class I molecule. Said MHC class I molecule may be any MHC class I molecule, such as an HLA-A molecule, for  
30 example HLA-A2. Preferred MHC class I molecules are frequently occurring MHC class I molecules, for example the MHC class I molecules described herein below.

It is preferred that the  $C_{50}$  value is determined according to the assembly assay described herein below.

Accordingly, in one embodiment of the present invention preferred fragments of ML-IAP may be selected from the group consisting of ML-IAP<sub>280</sub>, ML-IAP<sub>83</sub>, ML-IAP<sub>154</sub>, ML-IAP<sub>245</sub>, ML-IAP<sub>54</sub> and ML-IAP<sub>99</sub>. More preferred fragments of ML-IAP may be selected from the group consisting of ML-IAP<sub>245</sub>, ML-IAP<sub>54</sub> and ML-IAP<sub>99</sub>.

#### Assembly assay

Assembly assays for binding of the synthetic peptides to class I MHC molecules metabolically labeled with [<sup>35</sup>S]-methionine can be carried out as described below. It will be appreciated by the person skilled in the art that the protocol may be ~~adoptes~~ adopted for any peptide and any class I MHC molecule. Previously, it has been demonstrated that the peptide concentration resulting in half-maximal binding in an assembly assay for peptide binding to class I MHC is a good approximation of  $K_a$ <sup>15</sup>.

Briefly, TAP deficient cells were metabolically labeled with [<sup>35</sup>S]-methionine (Amersham, Freiburg, Germany). The cells were lysed in 0.5 ml lysis buffer (150 mM NaCl, 50 mM TrisHCl, 0.5 % NP-40 (Fluka, Buchs, Switzerland), 5 mM EDTA, pH 7.5) with 0.5 % Mega-9 (Sigma, St. Louis, USA) in the presence of protease inhibitors (2 mM PMSF, 5 mM iodoacetamide, 2 µg/ml pepstatin, 2 µg/ml leupeptin) with or without synthetic peptide (for a list of positive control peptides, see Table 2).

After 20 min of incubation, the cell nuclei were removed by centrifugation (5 min, 10,000 g) and 50 µl (10 % v/v) freshly washed Staphylococcus aureus organisms (Pansorbin, Calbiochem, Nottingham, UK). The next day Pansorbin was removed by centrifugation (12 min, 16,000 g) and the appropriate monoclonal antibody was added at a final concentration of 10 µg/ml, incubated for 90 min, followed by addition of protein A-Sepharose (75 µl, 10 % v/v) and incubation for 1 h. The beads were washed 4 times and stored at -20°C until analysis by electrophoresis.

For peptide binding to HLA-B\*2705 and H-2K<sup>k</sup> a modified assembly assay was used as described previously by us<sup>39</sup>. When transfected into T2 cells B\*2705 and K<sup>k</sup> are unusually stable in the absence of added peptide. To circumvent this, a mild heating step was introduced in order to preferentially destabilize MHC molecules which remain empty after peptide incubation. Briefly, the cell lysates are incubated with pep-

time for 2 h at 4°C, allowing the binding of peptide to empty class I molecules. Next, the cell lysates were heated (60°C for 5 min for T2-B\*2705 or 55°C for 2 min for T2-K<sup>k</sup>). Pansorbin was then added to the samples as in the conventional assembly assay.

5

### Electrophoresis

In the case of an assembly assay with the HLA class I-specific conformation-dependent monoclonal antibody W6/32, samples were eluted in reducing buffer (9.5 M urea, 2 % NP-40, 5 % 2-mercaptoethanol, 2 % Ampholines, pH range 3.5-9.5 (Pharmacia Biotech, Uppsala, Sweden)) and focused for 16 h at 880 V on 5.5 % polyacrylamide isoelectric focusing (IEF) gels<sup>20,39</sup>.

Samples from assembly assays with allele-specific antibodies were eluted by boiling (5 min) in SDS reducing buffer (50 mM TrisHCl pH 6.8, 2 %SDS, 5 % 2-mercaptoethanol, 10 % glycerol, 2.5 % bromophenol blue) and electrophoresed on 12 % SDS-PAGE gels (1 h at 200 V). All gels were fixed in 10 % acetic acid with 5 % methanol and dried onto 3 MM paper (Whatman, Maidstone, UK). MHC heavy chain bands were quantified using the Imagequant Phosphorimager program (Molecular Dynamics, Sunnyvale, CA, USA). The intensity of the band is directly related to the amount of peptide-bound class I MHC complex recovered during the assay. C<sub>50</sub> value (μM) as the concentration of the peptide required for half maximal binding to MHC may thus be determined. The binding affinities of the analysed peptides are determined according to their efficiency of stabilising the HLA class I molecules. The binding affinity is represented as the peptide concentration required to reach half-maximal stabilisation of appropriate HLA-molecule. Previous analyses have shown that the C50 values measured in this assay fits well with the dissociation constant (K<sub>d</sub>) of the complex<sup>31</sup>.

Epitope prediction may be performed using a suitable algorithm, preferably an algorithm based on the book "MHC Ligands and Peptide Motifs" by H.G. Rammensee, J.Bachmann and S.Stevanovic. However, such epitope prediction is not reliable, and thus it is preferred within the present invention that ML-IAP fragments are identified using ELISPOT assays and/or binding assays as described herein elsewhere.

One method of predicting epitopes is using the SYFPEITHI epitope prediction algo-

rithm. Further explanations on the algorithm can be found in HG Rammensee, J Bachmann, NPN Emmerich, OA Bachor and S Stevanovic (1999) SYFPEITHI: database for MHC ligands and peptide motifs. Immunogenetics 50: 213-219.

SYFPEITHI database can be found on the internet site: [http://syfpeithi.bmi-](http://syfpeithi.bmi-heidelberg.com/scripts/MHCServer.dll/home.htm)

5 [heidelberg.com/scripts/MHCServer.dll/home.htm](http://syfpeithi.bmi-heidelberg.com/scripts/MHCServer.dll/home.htm)

The algorithm calculates the predicted ligation strength to a defined HLA type for a sequence of aminoacids. Preferred ML-IAP has a predicted ligation strength to a given HLA molecule as calculated using said algorithm of at least 10, preferably at  
10 least 12, more preferably at least 15, even more preferably at least 16, such as at least 18, for example at least 20.

However, even more preferred fragments according to the present invention are ML-IAP fragments capable of raising a specific T-cell response as determined by an  
15 ELISPOT assay, for example the ELISPOT assay described herein below. Some fragments of ML-IAP although not binding MHC with high affinity still may give rise to a T-cell response as determined by ELISPOT. Other fragments of ML-IAP may be capable of binding MHC with high affinity and gives rise to a T-cell response as determined by ELISPOT. Both kinds of fragments are preferred fragments according to  
20 the invention.

Hence, preferred fragments according to the present invention are ML-IAP fragments capable of raising a specific T-cell response as measured by an ELISPOT assay, wherein more than 50 fragment specific spots per  $10^8$  cells, more preferably  
25 per  $10^7$  cells, even more preferably per  $10^6$  cells, yet more preferably per  $10^5$  cells, for example per  $10^4$  cells are measured

Hence, in one embodiment of the present invention preferred ML-IAP fragments may be selected from the group consisting of ML-IAP<sub>245</sub> (SEQ ID NO:297), ML-IAP<sub>280</sub>  
30 (SEQ ID NO:298) and ML-IAP<sub>230</sub>, (SEQ ID NO:301). Further preferred fragments peptides comprising or even more preferably consisting of SEQ ID NO:245.

## ELISPOT

### Antigen stimulation of PBL

5

Peripheral blood was obtained from melanoma patients before vaccination and subsequent to a series of vaccinations. In order to identify peptide-specific T-cell precursors, peripheral blood lymphocytes (PBL) were used directly in the ELISPOT (designated direct ELISPOT). However, to extend the sensitivity of the ELISPOT assay, 10 PBL were stimulated once in vitro prior to analysis<sup>17,18</sup>. At day 0, PBL or crushed lymph nodes were thawed and plated in 2 ml/well at a concentration of  $2 \times 10^6$  cells in 24-well plates (Nunc, Denmark) in X-vivo medium (Bio Whittaker, Walkersville, Maryland), 5% heat-inactivated human serum, and 2 mM of L-glutamine in the presence of 10  $\mu$ M of peptide. Two days later 20 IU/ml recombinant interleukin-2 (IL-2) 15 (Chiron, Ratingen, Germany) was added to the cultures. The cultured cells were tested for reactivity in the ELISPOT on day 8.

### ELISPOT assay

20

The ELISPOT assay used to quantify peptide epitope specific interferon- $\gamma$  releasing effector cells was adapted from Lalvani *et al.*<sup>37</sup>, and Scheibenbogen *et al.*<sup>38</sup>. Briefly, nitrocellulose bottomed 96-well plates (MultiScreen MAIP N45, Millipore) were coated overnight at 4°C with 7.5  $\mu$ g/ml of anti-IFN- $\gamma$  antibody (1-D1K, Mabtech, Sweden) in 75  $\mu$ l sterile PBS. Subsequently, the wells were washed six times with 25 PBS, and non-specific binding were blocked by X-vivo medium for 2 hours at 37°C. Freshly isolated PBL or cells, which had been stimulated once in vitro, were added in duplicates at different cell concentrations (from  $10^6$  to  $10^5$  cells per well for non-stimulated PBL, and from  $3 \times 10^5$  –  $3 \times 10^4$  cells per well for PBL which had been stimulated once in vitro), in 100  $\mu$ l X-vivo medium. Peptides were then added to 30 each well to a final concentration of 2  $\mu$ M and incubated overnight at 37°C.

The following day, media was discarded and the wells were washed (six times) with PBS containing 0.05 % Tween (PBS/Tw) before the addition of biotinylated secondary antibody (7-B6-1-Biotin, Mabtech) at 0.5  $\mu$ g/ml in 75  $\mu$ l PBS containing 1% BSA 35 and 0.02 %  $\text{NaN}_3$  (PBS/BSA). The plates were incubated at room temperature for 2

hours. The wells were washed (six times) with PBS/Tw. Then 75 µl of Avidin-enzyme conjugate (AP-Avidin, Calbiochem) diluted 1:2000 in PBS/BSA were added to each well and incubated for 1 hour. The enzyme substrate NBT/BCIP was prepared freshly according to the manufacturers' instructions (Gibco, code 18280-016) and 75 µl were added to each well and incubated for 5-10 min. The reaction was terminated by washing with tap-water upon the ~~emergency-emergence~~ of dark purple spots. The spots were then counted using the Alphamager System (Alpha Innotech, San Leandro, CA, USA) and the peptide specific CTL frequency could be calculated as the number of spot-forming cells.

It is preferred that the ELISPOT assay is performed using PBL derived from an individual that has not previously been immunised with ML-IAP or a fragment thereof. More preferably, said individual has not been subjected to any kind of immune therapy against a neoplastic disease. Hence it is for example preferred that the individual has not been immunised with tumour cells previously. PBL from individuals that have been subjected to immune therapy, in particular immune therapy comprising ML-IAP, may give a positive result against a given peptide in an ELISPOT assay, even though PBL from a naive person would not have given a positive result.

In yet another embodiment of the present invention, preferred ML-IAP fragments are fragments capable of activating T-cell growth in vitro. In particular, preferred ML-IAP fragments induce expansion of antigen-specific CTL using DC loaded with said fragments. A method of expanding antigen-specific CTLs is described herein below. Accordingly, very preferred ML-IAP fragments includes fragments, wherein more than  $10^5$  antigen specific CTLs, more preferably  $10^6$ , even more preferably  $10^7$  antigen specific CTLs may be harvested after 4 stimulation cycles starting with  $10^4$  PBMC as described herein below.

#### Expansion of antigen-specific CTL using antigen-loaded DC

The generation of dendritic cells (DC) was performed as described<sup>40</sup>. PBMC were plated in 85 mm dishes (either bacteriological, Primaria or Tissue culture dishes, Falcon, Cat. No. 1005, 3038 or 3003; Becton Dickinson, Hershey, USA) at a density of  $50 \times 10^6$  cells per dish in 10 ml of complete culture medium and incubated at 37°C and 5% CO<sub>2</sub> for 1 h. After a microscopic control of adherence, the non-adherent

fraction was removed and 10 ml of fresh, *warm* complete medium (RPMI 1640 (Prod. Nr. 12-167, Bio Whittaker, Walkersville, USA) supplemented with gentamicin (Refobacin 10, Merck, Darmstadt, Germany) at 20 µg/ml final concentration, glutamine at 2 mM final concentration (Prod. Nr. 17-605, Bio Whittaker) and 1% heat inactivated (56° for 30 min) human plasma) were added (day 0). The non-adherent fractions were centrifuged and plated once more in new 85 mm tissue-culture-dishes for readherence. The non-adherent fraction from these replate' dishes was discarded after 1 h adherence. All adherent fractions were cultured until day 1, then culture medium was taken off carefully so that loosely adherent cells were not removed, and new culture medium containing GM-CSF (800 U/ml final concentration) and IL-4 (1000 U/ml final concentration) was added. Cytokines were added again on day 3 in 3 ml fresh medium (containing 8000 U GM-CSF and 10,000 U IL-4) per dish. On day 5 all non-adherent cells were harvested, counted and replated in fresh complete medium (containing cytokines in the same dosage as described above) in 6 well plates at a density of  $5 \times 10^5$  cells/well in 3 ml medium. On day 6 750 µl monocyte conditioned medium (MCM) were added) to induce maturation of DC, and on day 7 or 8 cells were harvested.

All DC preparations were highly enriched in mature DC with > 90% showing a characteristic phenotype by flow cytometry (HLA-DR+++, CD86+++, CD40+, CD25+, CD14-). More than 80% of the cells expressed the CD83 antigen as marker for mature DC.

MCM was prepared in the following way: Ig coated bacteriological plates (85 mm, Falcon 1005) were prepared immediately prior to use. As immunoglobulin we used Sandoglobin<sup>(TM)</sup> (Novartis). Coating was performed with 10 ml of diluted (with PBS without calcium or magnesium, Bio Whittaker) immunoglobulin (10 µg/ml) for 10 min at room temperature. After the coating procedure plates were rinsed twice with PBS without calcium or magnesium (Bio Whittaker).  $50 \times 10^6$  PBMC were plated on these dishes in complete medium without cytokines and incubated at 37°C, 5% CO<sub>2</sub> for 20 h. Then the monocyte conditioned medium was harvested, centrifuged at 1360 g for 10 min (22°C), sterile filtered (0.22 µm filters, Millipore, Molsheim, France) and frozen down in aliquots at -20°C.

5  $5 \times 10^6$  cells/well DC were pulsed with 50  $\mu\text{g/ml}$  HLA-restricted peptide for example an ML-IAP fragment for 2 h at 37°C peptide. About  $10^4$  PBMC/well and  $5 \times 10^3$  antigen-loaded autologous DC/well were co-cultured in a 96-well round-bottom plates in 200  $\mu\text{l}$  MCM medium/well supplemented with 5% autologous plasma. On day 7,  
5 PBMC were restimulated either with antigen-loaded DC. After a total of 4 to 5 stimulation cycles  $\text{CD8}^+$  T lymphocytes were enriched from PBMC by depletion of  $\text{CD4}^+$ ,  $\text{CD11b}^+$ ,  $\text{CD16}^+$ ,  $\text{CD19}^+$ ,  $\text{CD36}^+$  and  $\text{CD56}^+$  cells with magnetic cell sorting using a midiMACS device (Miltenyi Biotec GmbH, Bergisch Gladbach, Germany). The resulting population consisted of >90%  $\text{CD8}^+$  T cells.

10

For expansion of specific CTLs, such as tumour specific CTLs, the  $\text{CD8}$ -enriched T cells were transferred to 25- $\text{cm}^2$  flasks coated with anti- $\text{CD3}$ /anti- $\text{CD28}$  mAbs, as described previously <sup>41</sup>. Briefly, 25- $\text{cm}^2$  flasks (Falcon, Heidelberg, Germany) were coated with anti-human  $\text{CD3}$  mAb (OKT3, Ortho Pharmaceutical Corp., Raritan, NJ)  
15 and anti-human  $\text{CD28}$  mAb (L293, Becton Dickinson) at a concentration of 1  $\mu\text{g/ml}$  in PBS/100 mM HEPES buffer (pH 9). After incubation overnight at 4°C, coated flasks were washed twice with PBS.  $\text{CD8}^+$  T cells were placed on the precoated and washed flasks at  $5 \times 10^5$  cells/ml in 10 ml MCM medium supplemented with 10% human AB serum (PAA Laboratories GmbH, Coelbe, Germany) and 100 IU IL-2/ml  
20 (EuroCetus, Amsterdam, Netherlands). Cells were restimulated with anti- $\text{CD3}$ /anti- $\text{CD28}$  mAbs once a week, culture medium and IL-2 (100 IU/ml) was changed twice a week. Part of  $\text{CD8}$ -purified CTL were expanded by weekly restimulation with antigen-loaded DC or PBL.

25 In some embodiments of the present invention preferred ML-IAP fragments are fragments capable of being presented by a specific MHC molecule. Hence, very preferred ML-IAP fragments may be fragments capable of raising a specific T-cell response in an individual with a specific tissue type. Preferred MHC molecules according to the invention are listed herein below.

30

In particular the peptides listed herein below, are preferred peptides for use in an individual of the specified tissue type:

#### HLA-A1

35 MLIAP85 G S E E L R L A S (SEQ ID NO:86)

15 A very preferred peptide is MLIAP245 R L Q E E R T C K (SEQ ID NO:245).

In another embodiment of the present invention preferred fragments of ML-IAP are fragments which may give rise to a specific T-cell response without leading to antibody production. Epitopes only leading to a T-cell response, but not an IgG response have been described in the prior art<sup>29,30</sup>.

20

### Methods of identifying fragments

In one aspect the present invention also relates to methods of selecting a peptide comprising a fragment of ML-IAP for use in a vaccine composition comprising the steps of

25

i) Providing an individual who has not been subjected to immune therapy

ii) Providing fragments of ML-IAP

30 iii) Testing specific T-cell responses against fragments of ML-IAP in said individual

iv) Selecting fragments of ML-IAP wherein said T-cell response corresponds to or is better than a predetermined selection criterium.

The T-cell response may be tested according to any suitable method, it is however preferred that testing said T-cell response comprises an ELISPOT assay. The ELISPOT assay is preferably the assay described herein above.

- 5 Preferably, fragments giving rise to more than 50 peptide specific spots per  $10^6$  cells in an ELISPOT assay, preferably the ELISPOT assay described herein above, are selected.

#### Vaccine compositions and uses thereof

10

The present invention in one embodiment is directed to an immunogenic composition such as a vaccine composition capable of raising e.g. a specific T-cell response. The vaccine composition comprises ML-IAP (SEQ ID NO:1), and/or one or more fragments thereof. Preferably, the vaccine compositions comprise isolated ML-IAP and/or one or more isolated fragments thereof. The terms "ML-IAP peptide" as used  
15 herein below refers to ML-IAP (SEQ ID NO:1) and fragments thereof as described herein elsewhere. Any of the ML-IAP fragments described herein above may be comprised within said vaccine, in particular the preferred ML-IAP fragments described above may be comprised within a vaccine.

20

Hence, the vaccine compositions according to the invention may comprise more than one different ML-IAP fragment, such as 2, for example 3, such as 4, for example 5, such as 6, for example 7, such as 8, for example 9, such as 10, such as a number of fragments in the range of from 5 to 10, for example in the range of from  
25 10 to 15, such as in the range of from 15 to 20, for example in the range of from 20 to 30, such as in the range of from 30 to 40, for example in the range of from 40 to 60, such as in the range of from 60 to 100, for example in the range of from 100 to 200 different ML-IAP fragments.

30

The vaccine composition may comprise at least 1, more preferably at least 2, even more preferably at least 3, yet more preferably at least 4, for example at least 5, such as at least 6, for example 7 different ML-IAP fragments each capable of associating with a different HLA molecule selected from the group consisting of HLA-A2, HLA-A1, HLA-A3, HLA-A24, HLA-B7, HLA-B27 and HLA-B44.

35

In one embodiment of the present invention the different ML-IAP fragments are selected so that one vaccine composition comprises fragments capable of associating with different MHC molecules, such as different MHC class I molecule, i.e. the ML-IAP fragments are restricted to specific HLA's. Preferably, one vaccine composition comprises fragments capable of associating with the most frequently occurring MHC class I molecules. Preferred MHC class I molecules are listed herein elsewhere. Hence preferred vaccine compositions comprises different fragments capable of associating with at least 2 preferred, more preferably at least 3 preferred, even more preferably at least 4 preferred MHC class I molecules.

In another embodiment of the invention, the vaccine composition comprises one or more fragments capable of associating to an MHC class I molecule and one or more fragments capable of associating with an MHC class II molecule. Peptide vaccine preparations capable of being used in accordance with the present invention may thus comprise a class I-restricted ML-IAP peptide and/or a class II-restricted ML-IAP peptide and/or fusion peptides comprising both peptides. Hence, such a vaccine composition is preferably capable of raising a specific cytotoxic T-cells response and/or a specific helper T-cell response.

The vaccine composition can further comprise an adjuvant and/or a carrier. Examples of useful adjuvants and carriers are given herein below. Thus ML-IAP, or the fragment thereof, present in the composition can be associated with a carrier such as e.g. a protein or an antigen-presenting cell such as e.g. a dendritic cell (DC) capable of presenting ML-IAP or a fragment thereof to a T-cell.

Adjuvants are any substance whose admixture into the vaccine composition increases or otherwise modifies the immune response to ML-IAP or a fragment. Carriers are scaffold structures, for example a polypeptide or a polysaccharide, to which ML-IAP, or the fragment thereof is capable of being associated.

Adjuvants could for example be selected from the group consisting of:  $\text{AlK}(\text{SO}_4)_2$ ,  $\text{AlNa}(\text{SO}_4)_2$ ,  $\text{AlNH}_4(\text{SO}_4)$ , silica, alum,  $\text{Al}(\text{OH})_3$ ,  $\text{Ca}_3(\text{PO}_4)_2$ , kaolin, carbon, aluminum hydroxide, muramyl dipeptides, N-acetyl-muramyl-L-threonyl-D-isoglutamine (thr-DMP), N-acetyl-nornuramyl-L-alanyl-D-isoglutamine (CGP 11687, also referred to as nor-MDP), N-acetylmuramyl-L-alanyl-D-isoglutaminyl-L-alanine-2-(1'2'-

dipalmitoyl-sn -glycero-3-hydroxyphosphoryloxy)-ethylamine (CGP 19835A, also referred to as MTP-PE), RIBI (MPL+TDM+CWS) in a 2% squalene/Tween-80.RTM. emulsion, lipopolysaccharides and its various derivatives, including lipid A, Freund's Complete Adjuvant (FCA), Freund's Incomplete Adjuvants, Merck Adjuvant 65, polynucleotides (for example, poly IC and poly AU acids), wax D from Mycobacterium, tuberculosis, substances found in Corynebacterium parvum, Bordetella pertussis, and members of the genus Brucella, liposomes or other lipid emulsions, Titermax, ISCOMS, Quil A, ALUN (see US 58767 and 5,554,372), Lipid A derivatives, cholera toxin derivatives, HSP derivatives, LPS derivatives, synthetic peptide matrixes or GMDP, Interleukin 1, Interleukin 2, Montanide ISA-51 and QS-21. Preferred adjuvants to be used with the invention include Montanide ISA-51 and QS-21.

Montanide ISA-51 (Seppic, Inc.) is a mineral oil-based adjuvant analogous to incomplete Freund's adjuvant, which must be administered as an emulsion. QS-21 (Antigenics; Aquila Biopharmaceuticals, Framingham, MA) is a highly purified, water-soluble saponin that handles as an aqueous solution. QS-21 and Montanide ISA-51 adjuvants can be provided in sterile, single-use vials.

Additional preferred adjuvants capable of being used in vaccine compositions comprising ML-IAP, and/or one or more fragments thereof, are e.g. any substance which promote an immune responses. Frequently, the adjuvant of choice is Freund's complete or incomplete adjuvant, or killed *B. pertussis* organisms, used e.g. in combination with alum precipitated antigen. A general discussion of adjuvants is provided in Goding, Monoclonal Antibodies: Principles & Practice (2nd edition, 1986) at pages 61-63. Goding notes, however, that when the antigen of interest is of low molecular weight, or is poorly immunogenic, coupling to an immunogenic carrier is recommended. Examples of such carrier molecules include keyhole limpet haemocyanin, bovine serum albumin, ovalbumin and fowl immunoglobulin. Various saponin extracts have also been suggested to be useful as adjuvants in immunogenic compositions. Recently, it has been proposed to use granulocyte-macrophage colony stimulating factor (GM-CSF), a well known cytokine, as an adjuvant (WO 97/28816).

Desirable functionalities of adjuvants capable of being used in accordance with the present invention are listed in the below table.

**Table 1.** Modes of adjuvant action

Action	Adjuvant type	Benefit
1. Immunomodulation	Generally small molecules or proteins which modify the cytokine network	Upregulation of immune response. Selection of Th1 or Th2
2. Presentation	Generally amphipathic molecules or complexes which interact with immunogen in its native conformation	Increased neutralizing antibody response. Greater duration of response
3. CTL induction	<ul style="list-style-type: none"> <li>• Particles which can bind or enclose immunogen and which can fuse with or disrupt cell membranes</li> <li>• w/o emulsions for direct attachment of peptide to cell surface MHC-1</li> </ul>	Cytosolic processing of protein yielding correct class 1 restricted peptides  Simple process if promiscuous peptide(s) known
4. Targeting	<ul style="list-style-type: none"> <li>• Particulate adjuvants which bind immunogen. Adjuvants which saturate Kupffer cells</li> <li>• Carbohydrate adjuvants which target lectin receptors on macrophages and DCs</li> </ul>	Efficient use of adjuvant and immunogen  As above. May also determine type of response if targeting selective
5. Depot Generation	<ul style="list-style-type: none"> <li>• w/o emulsion for short term</li> </ul> Microspheres or nanospheres for long term	Efficiency  Potential for single-dose vaccine

10      A vaccine composition according to the present invention may comprise more than one different adjuvant. Furthermore, the invention encompasses a therapeutic composition further comprising any adjuvant substance including any of the above or combinations thereof. It is also contemplated that ML-IAP, or one or more fragments thereof, and the adjuvant can be administered separately in any appropriate sequence.

A carrier may be present independently of an adjuvant. The function of a carrier can for example be to increase the molecular weight of in particular ML-IAP fragments in order to increase their activity or immunogenicity, to confer stability, to increase the biological activity, or to increase serum half-life. Furthermore, a carrier may aid presenting ML-IAP, or the fragments thereof to T-cells. The carrier may be any suitable carrier known to the person skilled in the art, for example a protein or an antigen presenting cell. A carrier protein could be but is not limited to keyhole limpet hemocyanin, serum proteins such as transferrin, bovine serum albumin, human serum albumin, thyroglobulin or ovalbumin, immunoglobulins, or hormones, such as insulin or palmitic acid. For immunization of humans, the carrier must be a physiologically acceptable carrier acceptable to humans and safe. However, tetanus toxoid and/or diphtheria toxoid are suitable carriers in one embodiment of the invention. Alternatively, the carrier may be dextrans for example sepharose.

In one embodiment, the vaccine composition may comprise dendritic cells. The dendritic cells (DC) may be prepared and used in therapeutic procedure according to any suitable protocol, for example as described herein below. It will be appreciated by the person skilled in the art that the protocol may be adopted to use with patients with different HLA type and different diseases. The peptide in the below procedure can be any fragment of ML-IAP such as e.g. fragments of ML-IAP described herein, in particular preferred fragments of ML-IAP described herein.

#### DC-based vaccines and therapeutic procedures using DC

Cancer patients such as e.g. stage IV metastatic melanoma patients with progressive disease were entered into a DC-based vaccination trial e.g. after having failed to respond to chemotherapy. All patients provided informed consent to participate in the experimental vaccination and to donate blood for immunological monitoring.

Serological HLA typing revealed that the patients were HLA-A2. Dendritic cells (DC) were pulsed with 50 µg/ml HLA-restricted peptide for 1 h at 37°C peptide and 5 x 10<sup>6</sup> cells were administered subcutaneously at day 1 and 14, subsequently every 4 weeks, additional leukapheresis after 5 vaccinations.

All vaccine preparations were highly enriched in mature DC with > 90% showing a characteristic phenotype by flow cytometry (HLA-DR+++, CD86+++, CD40+, CD25+, CD14-). More than 80% of the cells expressed the CD83 antigen as marker for mature DC. The peptide used in the vaccination trial were synthesized at a GMP quality by Clinalfa (purity >98%).

The generation of DC for clinical use and quality control was performed as described<sup>40</sup>. PBMC were plated in 85 mm dishes (either bacteriological, Primaria or Tissue culture dishes, Falcon, Cat. No. 1005, 3038 or 3003; Becton Dickinson, Hershey, USA) at a density of  $50 \times 10^6$  cells per dish in 10 ml of complete culture medium and incubated at 37°C and 5% CO<sub>2</sub> for 1 h. After a microscopic control of adherence, the non-adherent fraction was removed and 10 ml of fresh, *warm* complete medium (RPMI 1640 (Prod. Nr. 12-167, Bio Whittaker, Walkersville, USA) supplemented with gentamicin (Refobacin 10, Merck, Darmstadt, Germany) at 20 µg/ml final concentration, glutamine at 2 mM final concentration (Prod. Nr. 17-605, Bio Whittaker) and 1% heat inactivated (56° for 30 min) human plasma) were added (day 0).

The non-adherent fractions were centrifuged and plated once more in new 85 mm tissue-culture-dishes for readherence. The non-adherent fraction from these 're-plate' dishes was discarded after 1 h adherence. All adherent fractions were cultured until day 1, then culture medium was taken off carefully so that loosely adherent cells were not removed, and new culture medium containing GM-CSF (800 U/ml final concentration) and IL-4 (1000 U/ml final concentration) was added. Cytokines were added again on day 3 in 3 ml fresh medium (containing 8000 U GM-CSF and 10,000 U IL-4) per dish. On day 5 all non-adherent cells were harvested, counted and replated in fresh complete medium (containing cytokines in the same dosage as described above) in 6 well plates at a density of  $5 \times 10^5$  cells/well in 3 ml medium. On day 6 750 µl monocyte conditioned medium (MCM) were added) to induce maturation of DC, and on day 7 or 8 cells were harvested.

MCM (monocyte conditioned medium) was prepared in the following way: Ig coated bacteriological plates (85 mm, Falcon 1005) were prepared immediately prior to use. As immunoglobulin we used Sandoglobin<sup>(TM)</sup> (Novartis). Coating was performed with 10 ml of diluted (with PBS without calcium or magnesium, Bio Whittaker) immu-

noglobulin (10 µg/ml) for 10 min at room temperature. After the coating procedure plates were rinsed twice with PBS without calcium or magnesium (Bio Whittaker). 50×10<sup>6</sup> PBMC were plated on these dishes in complete medium without cytokines and incubated at 37°C, 5% CO<sub>2</sub> for 20 h. Then the monocyte conditioned medium  
5 was harvested, centrifuged at 1360 g for 10 min (22°C), sterile filtered (0.22 µm filters, Millipore, Molsheim, France) and frozen down in aliquots at -20°C.<sup>18,38,42</sup>

### Peptide vaccines

10 Vaccine compositions may be prepared and administered using any conventional protocol known by a person skilled in the art. Below a non-limiting example of preparation of a vaccine composition according to the invention is given as well as a non-limiting example of administration of such as a vaccine. It will be appreciated by the person skilled in the art that the protocol may be easily adapted to any of the vaccine compositions described herein.  
15

ML-IAP peptides can e.g. be synthesized e.g. at the UVA Biomolecular Core Facility with a free amide NH<sub>2</sub> terminus and free acid COOH terminus. Each was provided as a lyophilized peptide, which was then reconstituted in sterile water and diluted  
20 with Lactated Ringer's solution (LR, Baxter Healthcare, Deerfield, IL) as a buffer for a final concentration of 67–80% Lactated Ringer's in water. These solutions were then sterile-filtered, placed in borosilicate glass vials, and submitted to a series of quality assurance studies including confirmation of identity, sterility, general safety, and purity, in accordance with FDA guidelines, as defined in IND 6453. Tests of peptide stability demonstrated no decrease in purity or in the peptide concentration,  
25 when these peptide solutions were stored at -20°C for 3 years.

In practical circumstances, patients will receive a vaccine comprising about 100 µg of a class I HLA-restricted ML-IAP peptide with or without a class II HLA-restricted  
30 ML-IAP helper peptide. The patients are vaccinated with e.g. about 100 µg of the class I HLA peptide in adjuvant alone, or were vaccinated with e.g. about 100 µg of the HLA class I-restricted peptide plus 190 µg of the class II-restricted helper peptide. The higher dose of the helper peptide was calculated to provide equimolar quantities of the helper and cytotoxic epitopes. Additionally, patients can be vaccinated  
35 with a longer peptide comprising the amino acid sequences of both peptides.

The above peptides, in 1-ml aqueous solution, can be administered either as a solution/suspension with about 100 µg of QS-21, or as an emulsion with about 1 ml of Montanide ISA-51 adjuvant.

5

Patients are immunized e.g. at day 0 and months 1, 2, 3, 6, 9, and 12, with the peptides plus adjuvant, for a total of seven immunizations. With rare exceptions, the vaccinations are administered to the same arm with each vaccine. The peptides were administered s.c.<sup>43,44</sup>

10

#### MHC molecules

In one embodiment of the present invention preferred ML-IAP fragments are fragments capable of associating with an MHC molecule. Because different MHC molecules have different affinities for a given peptide, different ML-IAP fragments may be preferred with different embodiments of the invention. The invention also relates to compositions comprising different ML-IAP fragments, which preferably have affinity for different MHC molecules.

15

Preferred MHC molecules according to the present invention are MHC class I molecules and MHC class II molecules, more preferably MHC class I molecules.

20

Preferred MHC class I molecules are the most commonly occurring MHC class I molecules. In one embodiment of the present invention the preferred MHC class I molecules may be selected from the group consisting of HLA-A2, HLA-A1, HLA-A3, HLA-A24, HLA-B7, HLA-B27 and HLA-B44.

25

Preferred compositions according to the present invention comprises at least 1, more preferably at least 2, even more preferably at least 3, yet more preferably at least 4, for example at least 5, such as at least 6, for example 7 different ML-IAP fragments each capable of associating with a different HLA molecule selected from the group consisting of HLA-A2, HLA-A1, HLA-A3, HLA-A24, HLA-B7, HLA-B27 and HLA-B44.

30

By way of example, a preferred composition may comprise one ML-IAP peptide capable of associating with HLA-A2 and an ML-IAP peptide capable of associating with HLA-A1 and an ML-IAP peptide capable of associating with HLA-A3 and an ML-IAP peptide capable of associating with HLA-A24.

5

#### Ex vivo methods for obtaining and cultivating T-cells

10 In one embodiment, the present invention relates to a method for activating and expanding T-cells specific for ML-IAP or fragments thereof as well as to T-cells obtained by such methods. Preferably, the methods related to cytotoxic T-cells specific for ML-IAP fragments. The methods preferably comprise the steps of co-cultivating T-cells and ML-IAP, or at least one fragment thereof, thereby activating the T-cells, and optionally isolating activated ML-IAP specific T-cells or ML-IAP fragment specific T-cells.

15 Co-cultivating T-cells and ML-IAP or fragments thereof may be done by any conventional method. For example methods involving antigen presenting cells, such as dendritic cells (DC) may be used. The method may thus comprise generating and loading monocyte-derived dendritic cells (DC) with ML-IAP fragment(s) and co-cultivating said DC and peripheral blood monocytes (PBMC) comprising T-cells or T-cells purified from PBMC. Optionally the ML-IAP specific T-cells may then be isolated. Preferably, the ML-IAP specific T-cells are cytotoxic T-cells.

20 One preferred method for generating and loading of monocyte-derived DC and for co-cultivating DC and peripheral blood monocytes (PBMC) is described herein above in the section "Expansion of antigen specific CTL using antigen-loaded CD":

25 However, different kinds of antigen presenting cells (APC) may be used with the invention.

30 In one example, there is provided a method for in vitro immunization with *Drosophila* Cells as APCs. Hence, the method may comprise generating *Drosophila melanogaster* cells expressing one or more different HLA molecules, loading said *Drosophila melanogaster* cells with ML-IAP fragment(s) and co-cultivating said Dro-

35

*sphila* cells with perifiral blood monocytes (PBMc) comprising T-cells or T-cells purified from PBMc. Thereby, ML-IAP specific T-cells may be generated. Preferably, said T-cells are cytotoxic T-cells. Optionally, T-cells may subsequently be isolated. One advantage of using *Drosophila melanogaster* cells is that they are non-viable at 37°C.

*Drosophila melanogaster* cells were used as APCs<sup>45,46</sup>. These cells are efficient vehicles for the presentation of peptides in the context of HLA class I, especially for de novo immunization of CD8<sup>+</sup> CTL. The Schneider S2 *Drosophila* cell line (American Type Culture Collection CRL 10974, Rockville, MD) was transduced with HLA-A2.1, CD80 (B7-1) and CD54 (intracellular adhesion molecule-1) with a pRmHa-3 plasmid vector. *Drosophila* cells were grown in Schneider's medium (10<sup>6</sup> cells/mL) with 10% fetal bovine serum and CuSO<sub>4</sub> at 27°C, the optimal temperature for these insect cells. They were harvested, washed, and resuspended in X-press medium (Bio Whittaker, Walkersville, MD) containing 100 µg/mL of the HLA-restricted peptide epitope.

CD8<sup>+</sup> T cells were obtained from peripheral blood mononuclear cells (PBMCs) by positive selection with a novel anti-CD8 monoclonal antibody (mAb) captured with a sheep anti-mouse magnetic bead (Dynal, Lake Success, NY)<sup>47</sup>.

After incubation at 27°C with the HLA-restricted peptide epitope for 3 hours, the *Drosophila* cells were incubated with the CD8<sup>+</sup> T cells at 37°C at a ratio of 1:10 in RPMI 1640 medium containing 10% autologous serum. Two days later, 20 IU of IL-2 and 30 IU of IL-7 were added to the growth medium. Incubation was continued for 1 week, after when the *Drosophila* cells were replaced with autologous irradiated PBMCs (30 Gy) and the HLA-restricted peptide. This was repeated for one additional round of stimulation, after when the CD8<sup>+</sup> T cells were tested for cytotoxicity by a 4-hour<sup>51</sup>Cr release assay. The final preparation contained at least 92% CD8<sup>+</sup> T cells, with 4% or less CD16<sup>+</sup> (natural killer) cells and 4% or less CD4<sup>+</sup> T cells.

The present invention also relates to methods of treating a clinical condition in an individual in need thereof, comprising (re)infusing ML-IAP specific T-cells into. Furthermore the invention relates to use of ML-IAP specific T-cells for the preparation of a medicament for treatment of a clinical condition in an individual in need thereof

and to medicaments for treating a clinical condition comprising ML-IAP specific T-cells as active ingredient.

5 Methods of (re)infusing T-cells to an individual are known in the art. One example of a suitable method is outlined herein below.

10 In yet another embodiment there is provided a method for obtaining T cells from an individual and reinfusing the T cells after immunization ex vivo. Leukapheresis was performed to obtain approximately  $1 \times 10^{10}$  peripheral-blood mononuclear cells (PBMCs). After three rounds (3 weeks) of in vitro immunization, formal mycologic and bacteriologic testing was performed to verify sterility before the cells were administered.

15 No *Drosophila* cells remained in the CTL preparation after the immunization procedure. *Drosophila* cells are viable at 27°C but are nonviable at 37°C. Furthermore, two rounds of immunization with changes of medium each time were performed subsequent to the initial immunization with the fly cells. Finally, the polymerase chain reaction was used in order to detect residual *Drosophila* DNA in the final preparation of CTL before reinfusion. *Drosophila* DNA was uniformly absent by this sensitive method.

20 For infusion into the patient, the CTLs were resuspended in 200 mL of 0.9% saline with 5% human serum albumin in a transfer pack (Baxter [McGaw Park, IL] catalog no. 4R-2014 plastic blood cell infusion bag) and were administered intravenously over a period of 1 hour on the stem-cell transplantation unit. Experienced nurses took vital signs every 15 minutes and monitored the patients for signs of toxicity or immediate hypersensitivity reactions.

### 30 Combination therapy

The present invention furthermore relates to pharmaceutical compositions and kit-of-parts for use in combination therapy.

35 Combination therapy as used herein denotes treatment an individual in need thereof with more than one different method. Hence combination therapy may in one aspect

involve administration of a pharmaceutical composition or a kit of parts comprising a vaccine composition as described herein above and an anti-cancer medicament. Anti-cancer medicaments may be any of the medicaments described herein below, for example a chemotherapeutic agent or an immunotherapeutic agent.

5

In particular combination therapy may involve administration to an individual of a chemotherapeutic agent and/or an immunotherapeutic agent in combination with one or more of i) ML-IAP, or a fragment thereof, ii) an antigen presenting cell presenting ML-IAP, and iii) an activated, ML-IAP peptide specific T-cell. However, combination therapy may also involve radiation therapy, gene therapy and/or surgery.

10

Combination therapy thus may include administration, simultaneously, or sequentially in any order, of e.g.:

- 15 i) ML-IAP and/or fragments thereof + at least one chemotherapeutic agent
- ii) ML-IAP and/or fragments thereof + at least one immunotherapeutic agent
- iii) Antigen presenting cell presenting ML-IAP and/or fragments thereof + at least one chemotherapeutic agent
- iv) Antigen presenting cell presenting ML-IAP and/or fragments thereof + at least one immunotherapeutic agent
- 20 v) Activated T-cells + at least one chemotherapeutic agent
- vi) Activated T-cells + at least one immunotherapeutic agent

Further combinations include i) and ii); iii) and iv); v) and vi); i) and iii); i) and iv), i) and v); i) and vi); ii) and iii); ii) and iv); ii) and v); ii) and vi); iii) and v); iii) and vi); iv) and v); iv) and vi); i) and iv) and any of v) and vi).

25

The chemotherapeutic agent can be e.g. methotrexate, vincristine, adriamycin, cisplatin, non-sugar containing chloroethylnitrosoureas, 5-fluorouracil, mitomycin C, bleomycin, doxorubicin, dacarbazine, taxol, fragylone, Meglamine GLA, valrubicin, carmustaine and poliferposan, MM1270, BAY 12-9566, RAS famesyl transferase inhibitor, famesyl transferase inhibitor, MMP, MTA/LY231514, LY264618/Lometexol, Glamolec, CI-994, TNP-470, Hycamtin/Topotecan, PKC412, Valspodar/PSC833, Novantrone/Mitroxantrone, Metaret/Suramin, Batimastat, E7070, BCH-4556, CS-682, 9-AC, AG3340, AG3433, Incel/VX-710, VX-853, ZD0101, ISI641, ODN 698, TA

35

2516/Marmistat, BB2516/Marmistat, CDP 845, D2163, PD183805, DX8951f, Lemonal DP 2202, FK 317, Picibanil/OK-432, AD 32/Valrubicin, Metastron/strontium derivative, Temodal/Temozolomide, Evacet/liposomal doxorubicin, Yew-taxan/Paclitaxel, Taxol/Paclitaxel, Xeload/Capecitabine, Furtulon/Doxifluridine, Cyclopax/oral paclitaxel, Oral Taxoid, SPU-077/Cisplatin, HMR 1275/Flavopiridol, CP-358 (774)/EGFR, CP-609 (754)/RAS oncogene inhibitor, BMS-182751/oral platinum, UFT(Tegafur/Uracil), Ergamisol/Levamisole, Eniluracil/776C85/5FU enhancer, Campto/Levamisole, Camptosar/Irinotecan, Tumodex/Ralitrexed, Leustatin/Cladribine, Paxex/Paclitaxel, Doxil/liposomal doxorubicin, Caelyx/liposomal doxorubicin, Fludara/Fludarabine, Pharmarubicin/Epirubicin, DepoCyt, ZD1839, LU 79553/Bis-Naphtalimide, LU 103793/Dolastain, Caetyx/liposomal doxorubicin, Gemzar/Gemcitabine, ZD 0473/Anormed, YM 116, Iodine seeds, CDK4 and CDK2 inhibitors, PARP inhibitors, D4809/Dexifosamide, Ifes/Mesnex/Ifosamide, Vumon/Teniposide, Paraplatin/Carboplatin, Plantinol/cisplatin, Vepeside/Etoposide, ZD 9331, Taxotere/Docetaxel, prodrug of guanine arabinoside, Taxane Analog, nitrosoureas, alkylating agents such as melphelan and cyclophosphamide, Aminoglutethimide, Asparaginase, Busulfan, Carboplatin, Chlorombucil, Cytarabine HCl, Dactinomycin, Daunorubicin HCl, Estramustine phosphate sodium, Etoposide (VP16-213), Floxuridine, Fluorouracil (5-FU), Flutamide, Hydroxyurea (hydroxycarbamide), Ifosfamide, Interferon Alfa-2a, Alfa-2b, Leuprolide acetate (LHRH-releasing factor analogue), Lomustine (CCNU), Mechlorethamine HCl (nitrogen mustard), Mercaptopurine, Mesna, Mitotane (o.p'-DDD), Mitoxantrone HCl, Octreotide, Plicamycin, Procarbazine HCl, Streptozocin, Tamoxifen citrate, Thioguanine, Thiotepa, Vinblastine sulfate, Amsacrine (m-AMSA), Azacitidine, Erthropoietin, Hexamethylmelamine (HMM), Interleukin 2, Mitoguazone (methyl-GAG; methyl glyoxal bisguanyldrazone; MGBG), Pentostatin (2'deoxycoformycin), Semustine (methyl-CCNU), Teniposide (VM-26) and Vindesine sulfate. Furthermore, the chemotherapeutic agent may be any of the chemotherapeutic agents mentioned in table 3 of US 6,482,843 column 13 to 18.

30

The immunotherapeutic agent can be e.g. Ributaxin, Herceptin<sup>TM</sup> (Trastuzumab, a humanized monoclonal antibody that acts on the HER2/neu [erbB2] receptor), Quadramet<sup>TM</sup> (Samarium-153-ethylene diamine tetramethylene phosphonate), Panorex, IDEC-Y2B8, BEC2, C225, Oncolym, SMART MI 95, ATRAGEN, Ovarex, Bexxar, LDP-03, ior t6, MDX-210, MDX-11, MDX-22, OV103, 3622W94, anti-VEGF,

35

Zenapax, MDX-220, MDX-447, MELIMMUNE-2, MELIMMUNE-1, CEACIDE, Pre-target, NovoMAb-G2, TNT, Gliomab-H, GNI-250, EMD-72000, LymphoCide™ (Epratuzumab, a humanized monoclonal antibody that acts on CD22), CMA 676, Monopharm-C, 4B5, ior egf.r3, ior c5, BABS, anti-FLK-2, MDX-260, ANA Ab, SMART 1D10 Ab, SMART ABL 364 Ab and ImmuRAIT-CEA. Furthermore the immunotherapeutic agent may be any cytokine or interferon.

The therapeutic compositions or vaccine compositions of the invention can also be used in combination with other anti-cancer strategies, and such combination therapies are effective in inhibiting and/or eliminating tumor growth and metastasis. The methods of the present invention can advantageously be used with other treatment modalities, including, without limitation, radiation, surgery, gene therapy and chemotherapy.

“Combination therapy” can include the introduction of heterologous nucleic acids into suitable cells, generally known as gene therapy. For example gene therapy may involve introduction of tumour suppressor genes or apoptosis promoting genes into tumour cells. Alternatively, nucleic acid sequences inhibiting expression of oncogenes or apoptosis inhibiting genes may be introduced to tumour cells. Furthermore, genes that encode enzymes capable of conferring to tumor cells sensitivity to chemotherapeutic agents may be introduced. Accordingly, the present invention in one embodiment provides a method comprising the step of treating cancer by introducing a gene vector, encoding a protein capable of enzymatically converting a prodrug, i.e., a non-toxic compound, into a toxic compound. In the method of the present invention, the therapeutic nucleic acid sequence is a nucleic acid coding for a product, wherein the product causes cell death by itself or in the presence of other drugs. A representative example of such a therapeutic nucleic acid is one, which codes for thymidine kinase of herpes simplex virus. Additional examples are thymidine kinase of varicella zoster virus and the bacterial gene cytosine deaminase, which can convert 5-fluorocytosine to the highly toxic compound 5-fluorouracil.

Clinical indications capable of being treated with the present invention

The vaccine compositions or the therapeutic/pharmaceutical compositions disclosed herein may be used to treat a number of different clinical conditions. Furthermore, the present invention relates to methods of treatment of said clinical conditions in an individual in need thereof, methods of diagnosing said clinical conditions and use of

5 ML-IAP or fragments thereof for preparation of a medicament for treatment of a clinical condition in an individual in need thereof as well as to medicaments for treating a clinical condition comprising ML-IAP or fragments thereof as active ingredient.

10 In a preferred embodiment of the invention, the clinical condition is a cancer. The term "cancer" as used herein is meant to encompass any cancer, neoplastic and preneoplastic disease. Said cancer may for example be selected from the group consisting of colon carcinoma, breast cancer, pancreatic cancer, ovarian cancer, prostate cancer, fibrosarcoma, myxosarcoma, liposarcoma, chondrosarcoma,

15 osteogenic sarcoma, chordoma, angiosarcoma, endotheliosarcoma, lymphangeosarcoma, lymphangeoendothelia sarcoma, synovioma, mesothelioma, Ewing's sarcoma, leiomyosarcoma, rhabdomyosarcoma, squamous cell carcinoma, basal cell carcinoma, adenocarcinoma, sweat gland carcinoma, sebaceous gland carcinoma, papillary carcinoma, papillary adenocarcinomas, cystandeocarcinoma,

20 medullary carcinoma, bronchogenic carcinoma, renal cell carcinoma, hepatoma, bile duct carcinoma, choriocarcinoma, seminoma, embryonal carcinoma, Wilms' tumor, cervical cancer, testicular tumor, lung carcinoma, small cell lung carcinoma, bladder carcinoma, epithelial carcinoma, glioblastomas, neuronomas, craniopharyngiomas, schwannomas, glioma, astrocytoma, medulloblastoma, craniopharyngioma,

25 ependymoma, pinealoma, hemangioblastoma, acoustic neurooma, oligodendroglioma, meningioma, melanoma, neuroblastoma, retinoblastoma, leukemias and lymphomas, acute lymphocytic leukemia and acute myelocytic polycythemia vera, multiple myeloma, Waldenstrom's macroglobulinemia, and heavy chain disease, acute nonlymphocytic leukemias, chronic lymphocytic

30 leukemia, chronic myelogenous leukemia, Hodgkin's Disease, non-Hodgkin's lymphomas, rectum cancer, urinary cancers, uterine cancers, oral cancers, skin cancers, stomach cancer, brain tumors, liver cancer, laryngeal cancer, esophageal cancer, mammary tumors, childhood-null acute lymphoid leukemia (ALL), thymic ALL, B-cell ALL, acute myeloid leukemia, myelomonocytoid leukemia, acute

35 megakaryocytoid leukemia, Burkitt's lymphoma, acute myeloid leukemia, chronic

myeloid leukemia, and T cell leukemia, small and large non-small cell lung carcinoma, acute granulocytic leukemia, germ cell tumors, endometrial cancer, gastric cancer, cancer of the head and neck, chronic lymphoid leukemia, hairy cell leukemia and thyroid cancer.

5

In preferred embodiments of the invention the clinical condition is a type of cancer frequently expressing ML-IAP or a type of cancer wherein cell lines derived from said type of cancer frequently expresses ML-IAP. For example cell lines derived from malignant melanomas frequently express ML-IAP<sup>14,26</sup>, whereas cell lines derived from breast cancer often do not express ML-IAP<sup>26</sup>. It is very much preferred however, that the clinical condition is a cancer expressing ML-IAP.

10

In a preferred embodiment, the clinical condition is malignant melanoma.

15

In another embodiment of the invention the clinical condition is an auto-immune disease.

20

Autoimmune diseases may be loosely grouped into those primarily restricted to specific organs or tissues and those that affect the entire body. Examples of organ-specific disorders (with the organ affected) include multiple sclerosis (myelin coating on nerve processes), type I diabetes mellitus (pancreas), Hashimoto's thyroiditis (thyroid gland), pernicious anemia (stomach), Addison's disease (adrenal glands), myasthenia gravis (acetylcholine receptors at neuromuscular junction), rheumatoid arthritis (joint lining), uveitis (eye), psoriasis (skin), Guillain-Barre Syndrome (nerve cells) and Grave's disease (thyroid). Systemic autoimmune diseases include systemic lupus erythematosus and dermatomyositis.

25

Other examples of hypersensitivity disorders include asthma, eczema, atopic dermatitis, contact dermatitis, other eczematous dermatitides, seborrheic dermatitis, rhinitis, Lichen planus, Pemphigus, bullous Pemphigoid, Epidermolysis bullosa, urticaria, angioedemas, vasculitides, erythemas, cutaneous eosinophilias, Alopecia areata, atherosclerosis, primary biliary cirrhosis and nephrotic syndrome. Related diseases include intestinal inflammations, such as Coeliac disease, proctitis, eosinophilia gastroenteritis, mastocytosis, inflammatory bowel disease, Crohn's disease and ulcerative colitis, as well as food-related allergies.

35

The individual in need of treatment may be any individual, preferably a human being. Peptides will in general have different affinities to different HLA molecules.

Hence, in the embodiments of the present invention wherein the vaccine composition or the pharmaceutical composition comprises ML-IAP peptides, it is preferred that a vaccine composition or a pharmaceutical composition to be administered to a given individual will comprise at least one peptide capable of associating with HLA molecules of that particular individual.

The methods according to the present invention allows vaccination even of immunologically naive individuals, because the vaccine compositions according to the invention preferably comprises immunologically dominant ML-IAP fragments. Hence, in one embodiment of the present invention the individual in need of treatment has not previously been subjected to immune therapy against a neoplastic disease. In particular it is preferred that the individual has not previously been subjected to an immune therapy that comprised immunisation with a component comprising ML-IAP or a fragment thereof. Hence, for example it is preferred that said individual has not been immunised with a tumour cell expressing ML-IAP.

#### Pharmaceutical compositions

Accordingly, the invention in preferred embodiments relates to pharmaceutical compositions which comprise ML-IAP (SEQ ID NO:1), and/or variants or fragments of these molecules as defined herein above for the treatment of pathological disorders related to or mediated by the ML-IAP.

Pharmaceutically and/or veterinary useful therapeutic compositions according to the invention can be formulated according to known methods such as by the admixture of one or more pharmaceutically or veterinary acceptable excipients or carriers. Examples of such excipients, carriers and methods of formulation may be found e.g. in Remington's Pharmaceutical Sciences (Maack Publishing Co, Easton, PA). To form a pharmaceutically or veterinary acceptable composition suitable for effective administration, such compositions will contain an effective amount of a polypeptide, nucleic acid, antibody or compound modulator.

Therapeutic or diagnostic compositions of the invention are administered to an indi-

vidual (mammal-human or animal) or used in amounts sufficient to treat or diagnose apoptosis-related disorders. The effective amount may vary according to a variety of factors such as the individual's condition, weight, sex and age. Other factors include the mode of administration.

5

The term functional derivative includes a molecule that contains additional chemical moieties which are not normally a part of the base molecule. Such moieties may improve the solubility, half-life, absorption, etc. of the base molecule. Alternatively the moieties may attenuate undesirable side effects of the base molecule or decrease the toxicity of the base molecule. Examples of such moieties are described in a variety of texts, such as Remington's Pharmaceutical Sciences.

10

Pharmaceutical and veterinary compositions suitable for use in the present invention include compositions wherein the active ingredients are contained in an effective amount to achieve the intended purpose. The determination of an effective dose is well within the capability of those skilled in the art. The therapeutically effective dose can be estimated initially either in cell culture assays, eg, of neoplastic cells, or in animal models, usually mice, rabbits, dogs, or pigs. The animal model is also used to achieve a desirable concentration range and route of administration. Such information can then be used to determine useful doses and routes for administration in humans and other animals. A therapeutically effective dose refers to that amount of compound, peptide, antibody or nucleic acid which ameliorate or prevent a dysfunctional apoptotic condition. The exact dosage is chosen by the individual physician in view of the patient to be treated.

15

20

25

Compounds identified according to the methods disclosed herein as well as, therapeutic antibodies, therapeutic nucleic acids and peptides contemplated herein may be used alone at appropriate dosages defined by routine testing in order to obtain optimal modulation of livin activity. In addition, co-administration or sequential administration of these and other agents may be desirable.

30

The pharmaceutical or veterinary compositions may be provided to the individual by a variety of routes such as subcutaneous, topical, oral and intramuscular. Administration of pharmaceutical compositions is accomplished orally or parenterally.

35

Methods of parenteral delivery include topical, intra-arterial (directly to the tissue),

intramuscular, subcutaneous, intramedullary, intrathecal, intraventricular, intravenous, intraperitoneal, or intranasal administration. The present invention also has the objective of providing suitable topical, oral, systemic and parenteral pharmaceutical formulations for use in the novel methods of treatment of the present invention.

5 The compositions containing compounds identified according to this invention as the active ingredient for use in the modulation of a protein which mediates apoptosis can be administered in a wide variety of therapeutic dosage forms in conventional vehicles for administration. For example, the compounds can be administered in such oral dosage forms as tablets, capsules (each including timed release and sustained release formulations), pills, powders, granules, elixirs, tinctures, solutions, 10 suspensions, syrups and emulsions, or by injection. Likewise, they may also be administered in intravenous (both bolus and infusion), intraperitoneal, subcutaneous, topical with or without occlusion, or intramuscular form, all using forms well known to those of ordinary skill in the pharmaceutical arts. An effective but non-toxic amount of the compound, nucleic acid, or peptide desired can be employed as an apoptosis 15 modulating agent.

The daily dosage of the products may be varied over a wide range from 0.001 to 1,000 mg per adult human/per day. For oral administration, the compositions are 20 preferably provided in the form of scored or unscored tablets containing 0.01, 0.05, 0.1, 0.5, 1.0, 2.5, 5.0, 10.0, 15.0, 25.0, and 50.0 milligrams of the active ingredient for the symptomatic adjustment of the dosage to the patient to be treated. An effective amount of the drug is ordinarily supplied at a dosage level of from about 0.0001 mg/kg to about 100 mg/kg of body weight per day. The range is more particularly from about 0.001 mg/kg to 10 mg/kg of body weight per day. Even more particularly, 25 the range varies from about 0.05 to about 1 mg/kg.

Of course the dosage level will vary depending upon the potency of the particular compound. Certain compounds will be more potent than others. In addition, the 30 dosage level will vary depending upon the bioavailability of the compound. The more bioavailable and potent the compound, the less compound will need to be administered through any delivery route, including but not limited to oral delivery.

The dosages of livin modulators are adjusted when combined to achieve desired 35 effects. On the other hand, dosages of these various agents may be independently

optimized and combined to achieve a synergistic result wherein the pathology is reduced more than it would be if either agent were used alone. Those skilled in the art will employ different formulations for nucleotides than for proteins or their inhibitors.

5

There is also provided combination therapies comprising the step of administering the vaccine compositions according to the invention in combination with a chemotherapeutic agent and/or an immunotherapeutic agent and/or a cancer vaccine.

#### 10 Variants and functional equivalents of ML-IAP

The present invention is also directed to variants and functional equivalents of the above-listed fragments of ML-IAP.

15 The affinity of various HLA molecules towards a given peptide depends on the sequence of said peptide. In table 2 herein below the amino acids in a given position within a peptide that results in the highest affinity of said peptide to a given HLA molecule are described.

20 Hence, preferred variants of ML-IAP peptides with high affinity to a particular HLA molecule are listed herein below with an indication of the position in which a substitution preferably has occurred for each of the above-listed fragments. The preferred amino acid residue in the respective position of the variant is indicated in the table.

25 Accordingly, by way of example, a preferred ML-IAP peptide variant capable of binding to HLA-B54 has a proline at the second position.

30

Table 2. Primary anchor residue motifs employed

HLA allele	Position 1	Position 2	Position 3	Position 5	Position 6	Position 7	C-terminal
------------	------------	------------	------------	------------	------------	------------	------------

HLA-A1		T,S	D,E			L	Y
HLA-A2		L, M			V		L,V
HLA-A3		L,V,M	F,Y				K, Y, F
HLA-A11		V,I,F,Y	M,L,F,Y, I				K, R

HLA-Cw16		A,L					L,V

Functional equivalents and variants are used interchangeably herein. When being polypeptides, variants are determined on the basis of their degree of identity or their degree of homology with any predetermined sequence of consecutive amino acid sequences of a fragment of ML-IAP, such as e.g. SEQ ID NO:2 - SEQ ID NO:290.

5

One therefore initially define a sequence of consecutive ML-IAP amino acid residues and then define variants and functional equivalents in relation thereto.

Accordingly, variants preferably have at least 75% sequence identity, for example at least 80% sequence identity, such as at least 85 % sequence identity, for example at least 90 % sequence identity, such as at least 91 % sequence identity, for exam-

10

ple at least 91% sequence identity, such as at least 92 % sequence identity, for example at least 93 % sequence identity, such as at least 94 % sequence identity, for example at least 95 % sequence identity, such as at least 96 % sequence identity, for example at least 97% sequence identity, such as at least 98 % sequence identity, for example 99% sequence identity with the predetermined ML-IAP sequence of consecutive amino acid residues.

Sequence identity is determined in one embodiment by utilising fragments of peptides comprising at least 9 contiguous amino acids and having an amino acid sequence which is at least 80%, such as 85%, for example 90%, such as 95%, for example 99% identical to the amino acid sequence of any of SEQ ID NO:2 - SEQ ID NO:290, respectively, wherein the percent identity is determined with the algorithm GAP, BESTFIT, or FASTA in the Wisconsin Genetics Software Package Release 7.0, using default gap weights.

The following terms are used to describe the sequence relationships between two or more polynucleotides: "predetermined sequence", "comparison window", "sequence identity", "percentage of sequence identity", and "substantial identity". A "predetermined sequence" is a defined sequence used as a basis for a sequence comparison; a predetermined sequence may be a subset of a larger sequence.

Optimal alignment of sequences for aligning a comparison window may be conducted by the local homology algorithm of Smith and Waterman (1981) Adv. Appl. Math. 2: 482, by the homology alignment algorithm of Needleman and Wunsch (1970) J. Mol. Biol. 48: 443, by the search for similarity method of Pearson and Lipman (1988) Proc. Natl. Acad. Sci. (U.S.A.) 85: 2444, by computerized implementations of these algorithms (GAP, BESTFIT, FASTA, and TFASTA in the Wisconsin Genetics Software Package Release 7.0, Genetics Computer Group, 575 Science Dr., Madison, Wis.), or by inspection, and the best alignment (i.e., resulting in the highest percentage of homology over the comparison window) generated by the various methods is selected.

The term "sequence identity" means that two amino acid sequences are identical over the window of comparison.

The term "percentage of sequence identity" is calculated by comparing two optimally aligned sequences over the window of comparison, determining the number of positions at which identical amino acid residues occur in both sequences to yield the number of matched positions, dividing the number of matched positions by the total number of positions in the window of comparison (i.e., the window size), and multiplying the result by 100 to yield the percentage of sequence identity.

As applied to polypeptides, a degree of identity of amino acid sequences is a function of the number of identical amino acids at positions shared by the amino acid sequences. A degree of homology or similarity of amino acid sequences is a function of the number of amino acids, i.e. structurally related, at positions shared by the amino acid sequences.

The term "substantial identity" means that two peptide sequences, when optimally aligned, such as by the programs GAP or BESTFIT using default gap weights, share at least 75 percent sequence identity, such as at least 80 percent sequence identity, for example at least 85 percent sequence identity, such as e.g. at least 90 percent sequence identity, for example at least 95 percent sequence identity, such as at least 98 percent sequence identity, or even at least 99 percent sequence identity, compared to a predetermined sequence over a comparison window of at least 9 amino acid residues, such as 10 amino acid residues, for example 11 amino acid residues, such as 12 amino acid residues, for example 13 amino acid residues, such as 14 amino acid residues, for example 15 amino acid residues, such as 20 amino acid residues, for example 30 amino acid residues, such as 40 amino acid residues, for example 50 amino acid residues, such as 60 amino acid residues, for example 70 amino acid residues, such as 80 amino acid residues, for example 90 amino acid residues, such as 100 amino acid residues, for example 110 amino acid residues, such as 120 amino acid residues, for example 130 amino acid residues, such as 140 amino acid residues, for example 150 amino acid residues, such as 175 amino acid residues, for example 200 amino acid residues, such as 225 amino acid residues, for example 250 amino acid residues, such as 275 amino acid residues, for example 297 amino acid residues. Preferably, residue positions which are not identical differ by conservative amino acid substitutions.

An "unrelated" or "non-homologous" sequence shares less than 40% identity, though preferably less than 25% identity, with an ML-IAP amino acid sequence of the present invention.

5       Conservative amino acid substitutions refer in one embodiment to the interchange-  
ability of residues having similar side chains. For example, a group of amino acids  
having aliphatic side chains is glycine, alanine, valine, leucine, and isoleucine; a  
group of amino acids having aliphatic-hydroxyl side chains is serine and threonine, a  
group of amino acids having amide-containing side chains is asparagine and gluta-  
10       mine; a group of amino acids having aromatic side chains is phenylalanine, tyrosine,  
and tryptophan; a group of amino acids having basic side chains is lysine, arginine,  
and histidine; and a group of amino acids having sulfur-containing side chains is  
cysteine and methionine. Preferred conservative amino acids substitution groups  
are: valine-leucine-isoleucine, phenylalanine-tyrosine, lysine-arginine, alanine-  
15       valine, and asparagine-glutamine.

Additionally, variants are also determined based on a predetermined number of  
conservative amino acid substitutions as defined herein below. Conservative amino  
acid substitution as used herein relates to the substitution of one amino acid (within  
20       a predetermined group of amino acids) for another amino acid (within the same  
group), wherein the amino acids exhibit similar or substantially similar characteris-  
tics.

Within the meaning of the term "conservative amino acid substitution" as applied  
25       herein, one amino acid may be substituted for another within the groups of amino  
acids indicated herein below:

Amino acids having polar side chains (Asp, Glu, Lys, Arg, His, Asn, Gln, Ser, Thr,  
Tyr, and Cys,)

30

Amino acids having non-polar side chains (Gly, Ala, Val, Leu, Ile, Phe, Trp, Pro, and  
Met)

Amino acids having aliphatic side chains (Gly, Ala Val, Leu, Ile)

35

Amino acids having cyclic side chains (Phe, Tyr, Trp, His, Pro)

Amino acids having aromatic side chains (Phe, Tyr, Trp)

5 Amino acids having acidic side chains (Asp, Glu)

Amino acids having basic side chains (Lys, Arg, His)

Amino acids having amide side chains (Asn, Gln)

10

Amino acids having hydroxy side chains (Ser, Thr)

Amino acids having sulphur-containing side chains (Cys, Met),

15 Neutral, weakly hydrophobic amino acids (Pro, Ala, Gly, Ser, Thr)

Hydrophilic, acidic amino acids (Gln, Asn, Glu, Asp), and

Hydrophobic amino acids (Leu, Ile, Val)

20

Accordingly, a variant or a fragment thereof according to the invention may comprise at least one substitution, such as a plurality of substitutions introduced independently of one another. It is clear from the above outline that the same variant or fragment thereof may comprise more than one conservative amino acid substitution  
25 from more than one group of conservative amino acids as defined herein above.

The addition or deletion of at least one amino acid may be an addition or deletion of from preferably 2 to 250 amino acids, such as from 10 to 20 amino acids, for example from 20 to 30 amino acids, such as from 40 to 50 amino acids. However, additions or deletions of more than 50 amino acids, such as additions from 50 to 100 amino acids, addition of 100 to 150 amino acids, addition of 150-250 amino acids, are also comprised within the present invention. The deletion and/or the addition may - independently of one another - be a deletion and/or an addition within a sequence and/or at the end of a sequence.

35

The polypeptide fragments according to the present invention, including any functional equivalents thereof, may in one embodiment comprise a sequence of consecutive ML-IAP amino acid residues of less than 250 amino acid residues, such as less than 240 amino acid residues, for example less than 225 amino acid residues, such as less than 200 amino acid residues, for example less than 180 amino acid residues, such as less than 160 amino acid residues, for example less than 150 amino acid residues, such as less than 140 amino acid residues, for example less than 130 amino acid residues, such as less than 120 amino acid residues, for example less than 110 amino acid residues, such as less than 100 amino acid residues, for example less than 90 amino acid residues, such as less than 85 amino acid residues, for example less than 80 amino acid residues, such as less than 75 amino acid residues, for example less than 70 amino acid residues, such as less than 65 amino acid residues, for example less than 60 amino acid residues, such as less than 55 amino acid residues, for example less than 50 amino acid residues, such as less than 45 amino acid residues, for example less than 30 amino acid residues, such as less than 25 amino acid residues, for example less than 20 amino acid residues, such as less than 15 amino acid residues, for example 14 consecutive amino acid residues, such as 13 consecutive amino acid residues, for example 12 consecutive amino acid residues, such as 11 consecutive amino acid residues, for example 10 consecutive amino acid residues, such as 9 consecutive amino acid residues of ML-IAP (SEQ ID NO:1).

“Functional equivalency” as used in the present invention is according to one preferred embodiment established by means of reference to the corresponding functionality of a predetermined fragment of the sequence.

Functional equivalency can be established by e.g. similar binding affinities to HLA class I molecules, or similar potency demonstrated by ELISPOT assays.

Functional equivalents or variants of a ML-IAP fragment as described herein will be understood to exhibit amino acid sequences gradually differing from preferred, predetermined sequences, as the number and scope of insertions, deletions and substitutions including conservative substitutions, increases. This difference is measured as a reduction in homology between a preferred, predetermined sequence and the ML-IAP variant fragment or ML-IAP functional equivalent.

All ML-IAP fragments comprising or consisting of consecutive ML-IAP amino acid residues as well as variants and functional equivalents thereof are included within the scope of this invention, regardless of the degree of homology they show to a predetermined sequence. The reason for this is that some regions of the ML-IAP fragments are most likely readily mutable, or capable of being completely deleted, without any significant effect on e.g. the binding activity of the resulting fragment.

A functional variant obtained by substitution may well exhibit some form or degree of native binding activity, and yet be less homologous, if residues containing functionally similar amino acid side chains are substituted. Functionally similar in this respect refers to dominant characteristics of the side chains such as hydrophobic, basic, neutral or acidic, or the presence or absence of steric bulk. Accordingly, in one embodiment of the invention, the degree of identity is not a principal measure of a fragment being a variant or functional equivalent of a preferred predetermined fragment according to the present invention.

The homology between amino acid sequences may be calculated using well known algorithms such as any one of BLOSUM 30, BLOSUM 40, BLOSUM 45, BLOSUM 50, BLOSUM 55, BLOSUM 60, BLOSUM 62, BLOSUM 65, BLOSUM 70, BLOSUM 75, BLOSUM 80, BLOSUM 85, and BLOSUM 90.

Fragments sharing homology with fragments comprising or consisting of consecutive ML-IAP amino acid residues are to be considered as falling within the scope of the present invention when they are preferably at least about 90 percent homologous, for example at least 92 percent homologous, such as at least 94 percent homologous, for example at least 95 percent homologous, such as at least 96 percent homologous, for example at least 97 percent homologous, such as at least 98 percent homologous, for example at least 99 percent homologous with a predetermined ML-IAP fragment. According to one embodiment of the invention the homology percentages indicated above are identity percentages.

Additional factors that may be taken into consideration when determining functional equivalence according to the meaning used herein are i) the ability of antisera to detect a ML-IAP fragment according to the present invention, or ii) the ability of a

functionally equivalent ML-IAP fragment to compete with a predetermined ML-IAP fragment in an assay. One method for determining a sequence of immunogenically active amino acids within a known amino acid sequence has been described by Geysen in US 5,595,915 and is incorporated herein by reference.

5

A further suitably adaptable method for determining structure and function relationships of peptide fragments is described by US 6,013,478, which is herein incorporated by reference. Also, methods of assaying the binding of an amino acid sequence to a receptor moiety such as e.g. a T-cell receptor are known to the skilled artisan.

10

In addition to conservative substitutions introduced into any position of a preferred ML-IAP fragments, it may also be desirable to introduce non-conservative substitutions in any one or more positions of such a fragment. A non-conservative substitution leading to the formation of a functionally equivalent fragment would for example

15 i) differ substantially in polarity, for example a residue with a non-polar side chain (Ala, Leu, Pro, Trp, Val, Ile, Leu, Phe or Met) substituted for a residue with a polar side chain such as Gly, Ser, Thr, Cys, Tyr, Asn, or Gln or a charged amino acid such as Asp, Glu, Arg, or Lys, or substituting a charged or a polar residue for a non-

20 polar one; and/or ii) differ substantially in its effect on polypeptide backbone orientation such as substitution of or for Pro or Gly by another residue; and/or iii) differ substantially in electric charge, for example substitution of a negatively charged residue such as Glu or Asp for a positively charged residue such as Lys, His or Arg (and vice versa); and/or iv) differ substantially in steric bulk, for example substitution of a

25 bulky residue such as His, Trp, Phe or Tyr for one having a minor side chain, e.g. Ala, Gly or Ser (and vice versa).

Variants obtained by substitution of amino acids may in one preferred embodiment be made based upon the hydrophobicity and hydrophilicity values and the relative

30 similarity of the amino acid side-chain substituents, including charge, size, and the like. Exemplary amino acid substitutions which take various of the foregoing characteristics into consideration are well known to those of skill in the art and include: arginine and lysine; glutamate and aspartate; serine and threonine; glutamine and asparagine; and valine, leucine and isoleucine.

35

In a further embodiment the present invention relates to functional variants comprising substituted amino acids having hydrophilic values or hydrophobic indices that are within  $\pm 4.9$ , for example within  $\pm 4.7$ , such as within  $\pm 4.5$ , for example within  $\pm 4.3$ , such as within  $\pm 4.1$ , for example within  $\pm 3.9$ , such as within  $\pm 3.7$ , for example within  $\pm 3.5$ , such as within  $\pm 3.3$ , for example within  $\pm 3.1$ , such as within  $\pm 2.9$ , for example within  $\pm 2.7$ , such as within  $\pm 2.5$ , for example within  $\pm 2.3$ , such as within  $\pm 2.1$ , for example within  $\pm 2.0$ , such as within  $\pm 1.8$ , for example within  $\pm 1.6$ , such as within  $\pm 1.5$ , for example within  $\pm 1.4$ , such as within  $\pm 1.3$  for example within  $\pm 1.2$ , such as within  $\pm 1.1$ , for example within  $\pm 1.0$ , such as within  $\pm 0.9$ , for example within  $\pm 0.8$ , such as within  $\pm 0.7$ , for example within  $\pm 0.6$ , such as within  $\pm 0.5$ , for example within  $\pm 0.4$ , such as within  $\pm 0.3$ , for example within  $\pm 0.25$ , such as within  $\pm 0.2$  of the value of the amino acid it has substituted.

The importance of the hydrophilic and hydrophobic amino acid indices in conferring interactive biologic function on a protein is well understood in the art (Kyte & Doolittle, 1982 and Hopp, U.S. Pat. No. 4,554,101, each incorporated herein by reference).

The amino acid hydrophobic index values as used herein are: isoleucine (+4.5); valine (+4.2); leucine (+3.8); phenylalanine (+2.8); cysteine/cystine (+2.5); methionine (+1.9); alanine (+1.8); glycine (-0.4); threonine (-0.7); serine (-0.8); tryptophan (-0.9); tyrosine (-1.3); proline (-1.6); histidine (-3.2); glutamate (-3.5); glutamine (-3.5); aspartate (-3.5); asparagine (-3.5); lysine (-3.9); and arginine (-4.5) (Kyte & Doolittle, 1982).

The amino acid hydrophilicity values are: arginine (+3.0); lysine (+3.0); aspartate (+3.0,  $\pm 0.1$ ); glutamate (+3.0,  $\pm 0.1$ ); serine (+0.3); asparagine (+0.2); glutamine (+0.2); glycine (0); threonine (-0.4); proline (-0.5,  $\pm 0.1$ ); alanine (-0.5); histidine (-0.5); cysteine (-1.0); methionine (-1.3); valine (-1.5); leucine (-1.8); isoleucine (-1.8); tyrosine (-2.3); phenylalanine (-2.5); tryptophan (-3.4) (U.S. 4,554,101).

In addition to the peptidyl compounds described herein, sterically similar compounds may be formulated to mimic the key portions of the peptide structure and that such compounds may also be used in the same manner as the peptides of the invention.

This may be achieved by techniques of modelling and chemical designing known to those of skill in the art. For example, esterification and other alkylations may be employed to modify the amino terminus of, e.g., a di-arginine peptide backbone, to mimic a tetra peptide structure. It will be understood that all such sterically similar constructs fall within the scope of the present invention.

5 Variants and functional equivalents of ML-IAP also includes derivatives of ML-IAP or fragments thereof, for example ML-IAP or ML-IAP fragments substituted with one or more chemical moieties.

10 Peptides with N-terminal alkylations and C-terminal esterifications are also encompassed within the present invention. Functional equivalents also comprise glycosylated and covalent or aggregative conjugates formed with the same or other ML-IAP fragments, including dimers or unrelated chemical moieties. Such functional equivalents are prepared by linkage of functionalities to groups which are found in fragment including at any one or both of the N- and C-termini, by means known in the art.

20 Functional equivalents may thus comprise ML-IAP fragments conjugated to aliphatic or acyl esters or amides of the carboxyl terminus, alkylamines or residues containing carboxyl side chains, e.g., conjugates to alkylamines at aspartic acid residues; O-acyl derivatives of hydroxyl group-containing residues and N-acyl derivatives of the amino terminal amino acid or amino-group containing residues, e.g. conjugates with fMet-Leu-Phe or immunogenic proteins. Derivatives of the acyl groups are selected from the group of alkyl-moieties (including C3 to C10 normal alkyl), thereby forming alkanoyl species, and carbocyclic or heterocyclic compounds, thereby forming aroyl species. The reactive groups preferably are difunctional compounds known per se for use in cross-linking proteins to insoluble matrices through reactive side groups.

30 Covalent or aggregative functional equivalents and derivatives thereof are useful as reagents in immunoassays or for affinity purification procedures. For example, a ML-IAP fragment according to the present invention may be insolubilized by covalent bonding to cyanogen bromide-activated Sepharose by methods known per se or adsorbed to polyolefin surfaces, either with or without glutaraldehyde cross-linking, for use in an assay or purification of anti-ML-IAP fragment antibodies or cell surface

35

receptors. Fragments may also be labelled with a detectable group, e.g., radioiodinated by the chloramine T procedure, covalently bound to rare earth chelates or conjugated to another fluorescent moiety for use in e.g. diagnostic assays.

5 ML-IAP fragments according to the invention may be synthesised both in vitro and in vivo. In one embodiment the ML-IAP fragments of the invention are synthesised by automated synthesis. Any of the commercially available solid-phase techniques may be employed, such as the Merrifield solid phase synthesis method, in which amino acids are sequentially added to a growing amino acid chain. (See Merrifield, J. Am.  
10 Chem. Soc. 85:2149-2146, 1963).

Equipment for automated synthesis of polypeptides is commercially available from suppliers such as Applied Biosystems, Inc. of Foster City, Calif., and may generally be operated according to the manufacturer's instructions. Solid phase synthesis will  
15 enable the incorporation of desirable amino acid substitutions into any ML-IAP fragment according to the present invention. It will be understood that substitutions, deletions, insertions or any subcombination thereof may be combined to arrive at a final sequence of a functional equivalent. Insertions shall be understood to include amino-terminal and/or carboxyl-terminal fusions, e.g. with a hydrophobic or immu-  
20 nogenic protein or a carrier such as any polypeptide or scaffold structure capable as serving as a carrier.

Oligomers including dimers including homodimers and heterodimers of ML-IAP fragments according to the invention are also provided and fall under the scope of  
25 the invention. Functional equivalents and variants of ML-IAP fragments can be produced as homodimers or heterodimers with other amino acid sequences or with native ML-IAP sequences. Heterodimers include dimers containing immunoreactive ML-IAP fragments as well as ML-IAP fragments that need not have or exert any biological activity.

30

### Examples

The following section serves to more fully describe the manner of using the above-described invention, as well as to set forth the best modes contemplated for carrying out various aspects of the invention. It is understood that these examples in no way serve to limit the true scope of this invention, but rather are presented for illustrative purposes.

## Example 1

### Materials and Methods

#### Peptides

All peptides were purchased from Research Genetics (Huntsville, AL, USA) and provided at >80% purity as verified by HPLC and MS analysis. All peptides used are listed in Table 1.

#### Assembly assay for peptide binding to class I MHC molecules

Assembly assays for binding of the synthetic peptides to class I MHC molecules metabolically labeled with [<sup>35</sup>S]-methionine were carried out as described<sup>15,16</sup>. The assembly assay is based on stabilization of the class I molecule after loading of peptide to the peptide transporter deficient cell line T2. Subsequently correctly folded stable MHC heavy chains are immunoprecipitated using conformation-dependent antibodies. After IEF electrophoresis, gels were exposed to phosphorImager screens, and peptide binding was quantitated using the Imagequant PhosphorImager program (Molecular Dynamics, Sunnyvale, CA).

#### Antigen stimulation of PBL

To extend the sensitivity of the ELISPOT assay, PBL were stimulated once in vitro prior to analysis<sup>17,18</sup>. At day 0, PBL or crushed lymph nodes were thawed and plated in 2 ml/well at a concentration of  $2 \times 10^6$  cells in 24-well plates (Nunc, Denmark) in X-vivo medium (Bio Whittaker, Walkersville, Maryland), 5% heat-inactivated human serum, and 2 mM of L-glutamine in the presence of  $10^{-6}$  M of peptide.

Two days later 20 IU/ml recombinant interleukin-2 (IL-2) (Chiron, Ratingen, Ger-

many) was added to the cultures. The cultured cells were tested for reactivity in the ELISPOT on day 12.

#### ELISPOT assay

5

The ELISPOT assay used to quantify peptide epitope-specific ~~interferon- $\gamma$~~  interferon- $\gamma$ -releasing effector cells was performed as described previously <sup>19</sup>. Briefly, nitrocellulose bottomed 96-well plates (MultiScreen MAIP N45, Millipore, Hede-  
husene, Denmark) were coated with anti-IFN- $\gamma$  antibody (1-D1K, Mabtech, Nacka,  
10 Sweden). The wells were washed, blocked by X-vivo medium, and cells were added in duplicates at different cell concentrations. Peptides were then added to each well and the plates were incubated overnight. The following day, media was discarded and the wells were washed prior to addition of biotinylated secondary antibody (7-B6-1-Biotin, Mabtech). The plates were incubated for 2 hours, washed and Avidin-  
15 enzyme conjugate (AP-Avidin, Calbiochem, Life Technologies) was added to each well. Plates were incubated at RT for 1 hour and the enzyme substrate NBT/BCIP (Gibco, Life Technologies) was added to each well and incubated at RT for 5-10 min. The reaction was terminated by washing with tap-water upon the emergency of dark purple spots. The spots were counted using the Alphamager System (Alpha  
20 Innotech, San Leandro, CA. USA) and the peptide specific CTL frequency could be calculated from the numbers of spot-forming cells. The assays were all performed in duplicates for each peptide antigen.

#### **Example 2**

25

The present example demonstrates that ML-IAP is recognized as a tumor antigen in cancer patients as ML-IAP is subjected to T-cell responses.

The amino acid sequence of the ML-IAP polypeptide was screened for conceivable  
30 HLA-A2 nonamer and HLA-A2 decamer peptide epitopes by using the main HLA-A2 specific anchor residues <sup>20</sup>.

Twelve ML-IAP deduced peptides were synthesized and examined for binding to HLA-A2 by comparison with the HLA-A2 high affinity positive control epitope from

HIV-1 pol<sub>476-484</sub> (ILKEPVHGV) (Table 1). The peptide concentration required for half maximal recovery of class I MHC ( $C_{50}$  value) were 0.2  $\mu$ M for the positive control.

Five ML-IAP peptides bound with similar high affinity as the positive control;  
 5 MLIAP<sub>245</sub>, MLIAP<sub>90</sub>, MLIAP<sub>34</sub>, MLIAP<sub>54</sub>, and MLIAP<sub>99</sub> ( $C_{50}$  = 1, 0.2, 1, 1, and 0.9  $\mu$ M, respectively) (Table 1). The peptides MLIAP<sub>280</sub>, MLIAP<sub>83</sub>, and MLIAP<sub>154</sub> bound in comparison with intermediate affinity ( $C_{50}$  = 20, 30 and 10  $\mu$ M, respectively), whereas the peptides MLIAP<sub>230</sub> and MLIAP<sub>98</sub> bound only weakly to HLA-A2 ( $C_{50}$  >100  $\mu$ M). Two of the peptides examined (MLIAP<sub>261</sub>, MLIAP<sub>200</sub>) did not bind to HLA-  
 10 A2 (Table 1).

Using the ELISPOT IFN- $\gamma$  secretion assay, we examined the presence of specific T-cell responses against the ML-IAP deduced, HLA-A2 binding peptides in peripheral blood T cells (n = 7) or TIL (n = 22) from melanoma patients. The high sensitivity of  
 15 this assay allows reliable detection of as few as 10-100 specific T cells/1 million. In addition, before analysis, the T-cells were stimulated once *in vitro* to extend the sensitivity. This method has previously been shown to be highly effective to identify peptide epitopes recognized by CTL in cancer patients<sup>10,21,22</sup>. In contrast, other *ex vivo* assays such as intracellular IFN- $\gamma$  staining or tetramer analysis by flow cytometry  
 20 require approximately 10-fold higher specific T-cell frequencies for their detection.

In the first series of experiments T-cell reactivity against all 12 deduced ML-IAP peptides was examined. Based on these preliminary results we also included the weak HLA-A2 binding peptide ML-IAP<sub>230</sub> besides the better binding peptides for further  
 25 analysis. The strongest CTL responses were detected against the intermediate HLA-A2 binding peptide ML-IAP<sub>280</sub> (QLCPICRAPV), and such responses were detectable in both TIL and PBL.

Figure 1 illustrates these strong spontaneous responses detected in TIL and PBL  
 30 from three melanoma patients (Fig.1 A-D); each spot represents a peptide reactive, IFN- $\gamma$  producing cell. The average number of spots per peptide was calculated using a CCD scanning device and a computer system (Fig. 1 E). In addition, we were able to detect a response against ML-IAP<sub>280</sub> in one of the PBL samples and in TIL from seven patients (Fig.2). Moreover, a response was detected against the strong HLA-  
 35 A2 binding peptide ML-IAP<sub>245</sub> (RLQEERTCKV) in five of the TIL and one of the PBL

samples (Fig. 2). Further, we identified reactivity against the strong HLA-A2 binding peptide ML-IAP<sub>90</sub> (RLASFYDWPL) in seven TIL samples and in PBL from two patients (Fig. 2). Surprisingly, a response was detected against the weak HLA-A2 binding peptide MLIAP<sub>230</sub> (VLEPPGARDV) in six TIL cultures and in two samples of PBL even though this peptide were not able to stabilize the HLA-A2 molecule (Fig. 2).

Eleven of the 22 TIL samples and three of the seven PBL samples did not display any ML-IAP specific response (data not shown). Thus, spontaneous T-cell responses against ML-IAP was detected in approximately half of the patients examined.

Accordingly, fragments of the ML-IAP polypeptide was analysed for the presence of HLA-A2 binding motifs and - after successful identification - the fragments were used to test for specific T-cell reactivity in melanoma patients by ELISPOT assay. Following this strategy, we successfully identified strong CTL responses against the intermediate HLA-A2 binding peptide ML-IAP<sub>280</sub>.

Weaker spontaneous responses could be detected against three additional peptide epitopes, the strong HLA-A2 binding peptides MLIAP<sub>245</sub> and MLIAP<sub>90</sub> and the very weak binding peptide MLIAP<sub>230</sub>. In that respect, it is worth taking note that there are many factors, which determine a CTL response against a given peptide. These include expression level of the relevant source polypeptide, processing, TAP-transport, expression level of the class I MHC on the cell surface, TCR repertoire, CTL sensitivity, immuno-suppression and cytokines<sup>23</sup>. Thus, peptide binding to class I is one in a number of different factors which determine the immunogenicity of a given peptide. Additionally, in contrast to foreign peptides, when self-peptides are expressed on the cell surface at high density due to high MHC-binding affinity, tolerance seems to be induced, and reactive T cells are eliminated or inactivated<sup>24</sup>.

Subsequently, many immunodominant epitopes in CTL responses to self polypeptides may frequently be subdominant or cryptic, rather than dominant determinants. This may explain the observation that many epitopes from human melanoma antigens, which are non-mutated self-polypeptides, such as gp100 and MART-1 have relatively low binding affinities to class I MHC<sup>25</sup>. Given that the efficacy of tumor immunotherapy most likely depends on the avidity of recruited CTL<sup>32</sup>, low affinity

tumor epitopes might be important TAA, provided that they are able to mobilize their specific CTL repertoire and that they are presented by tumor cells efficiently enough to be recognized by CTL.

### 5      **Example 3**

One of the HLA-A2 antigen restricted epitopes identified from ML-IAP was the deca-mer peptide ML-IAP<sub>245</sub> (RLQEERTCKV). The following example relates to the analogue nona-mer peptide ML-IAP<sub>245-253</sub> (RLQEERTCK).

10

The deca-mer peptide is presented by melanoma-cells in the context of the HLA-A2 antigen. To investigate whether the nona-mer peptide likewise is generated by the antigen-processing machinery and subsequently is presented in the context of HLA-A3 antigen, we analyzed PBL from 14 HLA-A3 antigen positive melanoma patients for spontaneous immune responses by means of ELISPOT against this peptide. To this end, five of the melanoma patients hosted an immune response of more than 200 ML-IAP<sub>245-253</sub> (RLQEERTCK) specific T-cells per 10<sup>5</sup> CD8+ cells (Figure 3).

15

20

Thus, spontaneous immune responses against this epitope are present in around one third of the HLA-A3 antigen positive patients.

25

The characterization of multiple ML-IAP epitopes with different class I restriction elements broadens the clinical potential of this target antigen in two important ways: On one hand it increases the number of patients eligible for immunotherapy based on ML-IAP derived peptides, since although the HLA-A2 antigen is one of the most frequently expressed HLA class I molecules, it is still only expressed in around 50% of melanoma patients. The HLA-A3 antigen is expressed in by 30% of patients<sup>34</sup>. Co-expression is found in around 10% of patients. Thus, approximately 70% of the patients can be vaccinated with the ML-IAP epitopes identified.

30

35

On the other hand the collective targeting of several restriction elements, is likely to decrease the risk of immune escape by class I HLA-allele loss. Loss of a single class I HLA allele is a significant component of MHC alterations described in cancer cells, whereas total loss of class I HLA expression is a rather infrequent event. Although the percentage of patients expressing both HLA-A2 and HLA-A3 antigens is

only 10%, the identification of epitopes for other class I HLA alleles does increase this percentage of patients with allelic overlap.

#### Example 4

5

ML-IAP-reactive T cells were detected *in situ* in the following way.

HLA-A2 and ML-IAP<sub>245</sub>/HLA-A2-specific monomers were multimerized using dextran molecules, which were conjugated with both streptavidin and fluorescein isothiocyanate. Multimerized MHC complexes were used to stain acetone-fixed, frozen material as described previously<sup>11,48</sup> and antigen-specific cells were visualized using a confocal laser microscope. Sections of primary melanoma from six patients were analyzed, and ML-IAP<sub>280</sub>- and ML-IAP<sub>245</sub>-reactive CTL could readily be detected *in situ* in the tumor microenvironment in two of the patients (Figure 4).

15

#### Example 5

To characterize the functional capacity of ML-IAP-reactive CTL, these cells were isolated by means of magnetic beads coated with HLA-A2/ML-IAP complexes in a manner similar to that described in Schrama *et al.*, 2001<sup>36</sup>. ML-IAP<sub>245</sub>-specific cells were directly isolated from PBL (Figure 5A). ML-IAP<sub>280</sub>-reactive cells were enriched from TIL of a melanoma infiltrated lymph node after being stimulated once *in vitro* with peptide. These cells lyzed T2-cells in a peptide-specific manner (Figure 4B). Additionally, we tested the cytotoxicity of the ML-IAP<sub>280</sub>-reactive CTL against the autologous melanoma line FM72, the HLA-A2-matched melanoma cell line FM93 and the HLA mismatched melanoma cell line FM56. This analysis revealed that the ML-IAP<sub>280</sub>-reactive T cells efficiently lyzed both the autologous and the HLA-matched melanoma cell lines. In contrast, no cytotoxicity was observed against the HLA-A2-negative melanoma cell line FM56 or the natural killer target cell K562 (Figure 4C).

30

The data presented herein above demonstrate that ML-IAP, which is of crucial importance for the survival of a cancer cell, represent a novel tumor antigen. IAPs such as ML-IAP can advantageously be used for vaccination purposes as down-regulation or loss of the expression of such polypeptides (otherwise constituting a

35

form of immune escape) would impair sustained tumor growth. Specific useful peptides are identified.
